Chapter 1

Namespace Index

1.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

calcModule	Namespace for the calculation module	9
comModule	Namespace for the communication module	9
flybackModule	Namespace for the Flyback module	10
jsonModule	Namespace for the JSON module	11
locker	Namespace for the locker system	11
reportSystem	Namespace for the report system	12
sensorModule	Namespace for the sensor module	12
timeModule	Namespace for the timeModule	12
vacControlModule	Namespace for the VacControl module	13

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

calcModule::CalcModuleInternals	15
calcModuleInternals	23
comModule::ComModuleInternals	23
comModuleInternals	25
timeModule::DateTimeStruct	25
comModule::EthernetCommunication	25
flybackModule::Flyback	38
comModule::I2CCommunication	41
jsonModule::JsonModuleInternals	43
jsonModuleInternals	47
LockerBase	48
LogManager	49
LogMapper	56
flybackModule::Measurement	56
Measurement	56
MenuItem	57
Outputlevel	57
PointerWrapper< T >	58
vacControlModule::Pressure	60
PressureSensor	60
sensorModule::SensorModuleInternals	75
PtrUtils	62
reportSystem::ReportSystem	64
locker::ScopedLock	72
ScopedPointer< T >	73
comModule::SerialCommunication	78
SerialMenu	80
comModule::SPICommunication	87
TemperatureSensor	88
sensorModule::SensorModuleInternals	75
timeModule::TimeModuleInternals	91
vacControlModule::VacControl	96

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

calcModule::CalcModuleInternals	15
calcModuleInternals	
Class for the calculation module internals	23
comModule::ComModuleInternals	23
comModuleInternals	
Class for the communication module internals	25
timeModule::DateTimeStruct	
Struct to hold the date and time	25
comModule::EthernetCommunication	
Class to handle Ethernet communication	25
flybackModule::Flyback	
Flyback class to manage the Flyback system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes	38
comModule::I2CCommunication	
Class to handle I2C communication	41
jsonModule::JsonModuleInternals	43
jsonModuleInternals	
Class for the JSON module internals	47
LockerBase	
Base class for the locker system	48
LogManager	49
LogMapper	
Class which handle the printed log messages, maps aka parses them and saves them to the SD card	56
flybackModule::Measurement	
Structure to store the measured values of the system This structure holds the voltage, current, power, frequency and dutycycle values measured from the system	56
Measurement	
Structure to store the measured values of the system This structure holds the pressure values measured from the system	56
MenuItem	
Serial menu structure	57
Outputlevel	
Enum Class for the differnet Outputlevels	57

PointerWrapper< T >	
Template class for wrapping a pointer	58
vacControlModule::Pressure	60
PressureSensor	
Pressure sensor class	60
PtrUtils	
Utility class for pointer operations	62
reportSystem::ReportSystem	
Class for the report system	64
locker::ScopedLock	
Scoped lock class for mutexes	72
ScopedPointer< T >	
Template class for a Scoped Pointer	73
sensorModule::SensorModuleInternals	
Class for the sensor module internals	75
comModule::SerialCommunication	
Class to handle Serial communication	78
SerialMenu	
Class for the serial menu	80
comModule::SPICommunication	
Class to handle SPI communication	87
TemperatureSensor	
Temperature sensor class	88
timeModule::TimeModuleInternals	
Class to handle Systemtime	91
vacControlModule::VacControl	
VacControl class to manage the vacuum control system This class provides methods for initial- izing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes	96

Chapter 4

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/calcModule/calcModule.cpp	103
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/calcModule/calcModule.h	
Header file for the calculation module handling sensor data	104
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/comModule.cpp	
Implementation of the comModule class that utilizes various communication protocols	106
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/comModule.h	107
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/ETHH/ETHH.h	107
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/I2CC/I2CC.h	109
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/SER/SER.h	110
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/SPII/SPII.h	110
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/config/config.h	111
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/flyback/flyback.h	111
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/jsonModule/jsonModule.cpp	
Implementation of the jsonModule class	113
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/jsonModule/jsonModule.h	113
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/lockerBase/lockerBase.h	116
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/lockerBase/scopedLock.h	116
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/logManager/logManager.h	117
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/pressure/pressure.cpp	
Implementation of the pressure class	118
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/pressure/pressure.h	119
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/ptrUtils/ptrUtils.h	119
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/reportSystem/reportSystem.cpp	
Unified system health and error reporting module	121
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/reportSystem/reportSystem.h	122
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/sensorModule/sensorModule.h	125
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/serialMenu/serialMenu.h	128
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/temperature/temperature.cpp	
Implementation of the temperature class	128
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/temperature/temperature.h	129
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/timeModule/timeModule.cpp	
Implementation of the timeModule class	130
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/timeModule/timeModule.h	131
C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/vacControl/vacControl.h	132

Chapter 5

Namespace Documentation

5.1 calcModule Namespace Reference

Namespace for the calculation module.

Classes

- class [CalcModuleInternals](#)

Enumerations

- enum [Type](#) { **General** , **Pressure** , **Position** }
Enum for the different Types we want to extract from a response.

5.1.1 Detailed Description

Namespace for the calculation module.

5.2 comModule Namespace Reference

Namespace for the communication module.

Classes

- class [ComModuleInternals](#)
- class [EthernetCommunication](#)
Class to handle Ethernet communication.
- class [I2CCommunication](#)
Class to handle I2C communication.
- class [SerialCommunication](#)
Class to handle Serial communication.
- class [SPICommunication](#)
Class to handle SPI communication.

Enumerations

- enum class [Service](#) : uint8_t {
SET = 0x01 , **GET** = 0x0B , **SET_COMPOUND** = 0x28 , **GET_COMPOUND** = 0x29 ,
SETGET = 0x30 }
Enum class for the service types.
- enum class [Compound1](#) : uint32_t { **CONTROL_MODE** = 0x0F020000 , **TARGET_POSITION** = 0x11020000
, **TARGET_PRESSURE** = 0x07020000 , **NOT_USED** = 0x00000000 }
Enum class for the compound 1 types.
- enum class [Compound2](#) : uint32_t {
ACCESS_MODE = 0x0F0B0000 , **CONTROL_MODE** = 0x0F020000 , **TARGET_POSITION** = 0x11020000 ,
TARGET_PRESSURE = 0x07020000 ,
ACTUAL_POSITION = 0x10010000 , **POSITION_STATE** = 0x00100000 , **ACTUAL_PRESSURE** =
0x07010000 , **TARGET_PRESSURE_USED** = 0x07030000 ,
WARNING_BITMAP = 0x0F300100 , **NOT_USED** = 0x00000000 }
Enum class for the compound 2 types.
- enum class [Compound3](#) : uint32_t {
CONTROL_MODE = 0x0F020000 , **TARGET_POSITION** = 0x11020000 , **TARGET_PRESSURE** =
0x07020000 , **SEPARATION** = 0x00000000 ,
ACCESS_MODE = 0x0F0B0000 , **ACTUAL_POSITION** = 0x10010000 , **POSITION_STATE** = 0x00100000 ,
ACTUAL_PRESSURE = 0x07010000 ,
TARGET_PRESSURE_USED = 0x07030000 , **WARNING_BITMAP** = 0x0F300100 , **NOT_USED** =
0x00000000 }
Enum class for the compound 3 types.
- enum class [Error_Codes](#) : uint8_t {
NO_ERROR = 0x00 , **WRONG_COMMAND_LENGTH** = 0x0C , **VALUE_TOO_LOW** = 0x1C , **VALUE_↵**
TOO_HIGH = 0x1D ,
RESULTING_ZERO_ADJUST_OFFSET = 0x20 , **NO_SENSOR_ENABLED** = 0x21 , **WRONG_ACCESS_↵**
_MODE = 0x50 , **TIMEOUT** = 0x51 ,
NV_MEMORY_NOT_READY = 0x6D , **WRONG_PARAMETER_ID** = 0x6E , **PARAMETER_NOT_↵**

ALREADY_DONE = 0xA1 }
Enum class for the error codes.

5.2.1 Detailed Description

Namespace for the communication module.

5.3 flybackModule Namespace Reference

Namespace for the [Flyback](#) module.

Classes

- class [Flyback](#)
Flyback class to manage the Flyback system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes.
- struct [Measurement](#)
Structure to store the measured values of the system This structure holds the voltage, current, power, frequency and dutycycle values measured from the system.

Typedefs

- typedef struct [flybackModule::Measurement](#) **meas**

Enumerations

- enum class [SwitchStates](#) : int { **HV_Module_OFF** , **HV_Module_MANUAL** , **HV_Module_REMOTE** , **HV_Module_INVALID** }
enum for different SwitchStates of HVModule

5.3.1 Detailed Description

Namespace for the [Flyback](#) module.

5.4 jsonModule Namespace Reference

Namespace for the JSON module.

Classes

- class [JsonModuleInternals](#)

5.4.1 Detailed Description

Namespace for the JSON module.

5.5 locker Namespace Reference

Namespace for the locker system.

Classes

- class [ScopedLock](#)
Scoped lock class for mutexes.

5.5.1 Detailed Description

Namespace for the locker system.

5.6 reportSystem Namespace Reference

Namespace for the report system.

Classes

- class [ReportSystem](#)
Class for the report system.

5.6.1 Detailed Description

Namespace for the report system.

5.7 sensorModule Namespace Reference

Namespace for the sensor module.

Classes

- class [SensorModuleInternals](#)
Class for the sensor module internals.

Enumerations

- enum class [SensorType](#) {
 TEMPERATURE , OBJECTTEMPERATURE , AMBIENTTEMPERATURE , PRESSURE ,
 DHT11 , MCP9601_Celsius , MCP9601_Fahrenheit , MCP9601_Kelvin ,
 UNKNOWN }
Enum class for the sensor types.

5.7.1 Detailed Description

Namespace for the sensor module.

5.8 timeModule Namespace Reference

namespace for the [timeModule](#)

Classes

- struct [DateTimeStruct](#)
Struct to hold the date and time.
- class [TimeModuleInternals](#)
Class to handle Systemtime.

Typedefs

- typedef struct [timeModule::DateTimeStruct](#) **DateTimeStruct**

5.8.1 Detailed Description

namespace for the [timeModule](#)

5.9 vacControlModule Namespace Reference

Namespace for the [VacControl](#) module.

Classes

- struct [Pressure](#)
- class [VacControl](#)
[VacControl](#) class to manage the vacuum control system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes.

Typedefs

- typedef struct [vacControlModule::Pressure](#) **meas**

Enumerations

- enum class [SwitchStates](#) : int {
Main_Switch_OFF , **Main_Switch_MANUAL** , **Main_Switch_REMOTE** , **Main_switch_INVALID** ,
PUMP_ON , **PUMP_OFF** }
Enum to represent the states of the main switch and pump.
- enum [Scenarios](#) {
Scenario_1 = 0 , **Scenario_2** = 1 , **Scenario_3** = 2 , **Scenario_4** = 3 ,
Scenario_5 = 4 , **Invalid_Scenario** = -1 }
Enum to represent the different operating scenarios of the VacControl system.

5.9.1 Detailed Description

Namespace for the [VacControl](#) module.

Chapter 6

Class Documentation

6.1 calcModule::CalcModuleInternals Class Reference

Static Public Member Functions

- static float [calculateAverage](#) (const float *data, int length)
Function to calculate the average of a data set.
- static float [findMaximum](#) (const float *data, int length)
Function to calculate the maximum value of a data set.
- static float [findMinimum](#) (const float *data, int length)
Function to calculate the minimum value of a data set.
- static float [calculateStandardDeviation](#) (const float *data, int length)
Function to calculate the standard deviation of a data set.
- static float [findMedian](#) (float *data, int length)
Function to calculate the median of a data set.
- static float [celsiusToFahrenheit](#) (float celsius)
Function to convert celsius to fahrenheit.
- static float [fahrenheitToCelsius](#) (float fahrenheit)
Function to convert fahrenheit to celsius.
- static float [celsiusToKelvin](#) (float celsius)
Function to convert celsius to kelvin.
- static float [kelvinToCelsius](#) (float kelvin)
Function to convert kelvin to celsius.
- static float [pascalToAtm](#) (float pascal)
Function to convert pascal to atm.
- static float [atmToPascal](#) (float atm)
Function to convert atm to pascal.
- static float [pascalToPsi](#) (float pascal)
Function to convert pascal to psi.
- static float [psiToPascal](#) (float psi)
Function to convert psi to pascal.
- static float [calculatePower](#) (float voltage, float current)
Function to calculate the power.
- static float [calculateCurrent](#) (float voltage, float resistance)
Function to calculate the current.
- static float [calculateResistance](#) (float voltage, float current)

Function to caculate the Resistance.

- static float [extractFloat](#) (String response, int id)
Extract the float from a VAT uC eth frame.
- static float [extractFloatFromResponse](#) (const String &response, [Type](#) type)
Extract the float from a VAT uC eth frame, specific for positions and pressures.

6.1.1 Member Function Documentation

6.1.1.1 atmToPascal()

```
float CalcModuleInternals::atmToPascal (
    float atm ) [static]
```

Function to convert atm to pascal.

Parameters

<i>atm</i>	-> The pressure in atm.
------------	-------------------------

Returns

float -> The pressure in pascal.

6.1.1.2 calculateAverage()

```
float CalcModuleInternals::calculateAverage (
    const float * data,
    int length ) [static]
```

Function to calculate the average of a data set.

Parameters

<i>data</i>	-> The data set to calculate the average from.
<i>length</i>	-> The length of the data set.

Returns

float -> The average of the data set.

Here is the caller graph for this function:

6.1.1.3 calculateCurrent()

```
float CalcModuleInternals::calculateCurrent (
    float voltage,
    float resistance ) [static]
```

Funcion to calculate the current.

Parameters

<i>voltage</i>	-> The voltage.
<i>resistance</i>	-> The resistance.

Returns

float -> The calculated current.

6.1.1.4 calculatePower()

```
float CalcModuleInternals::calculatePower (
    float voltage,
    float current ) [static]
```

Function to calculate the power.

Parameters

<i>voltage</i>	-> The voltage.
<i>current</i>	-> The current.

Returns

float -> The calculated power.

6.1.1.5 calculateResistance()

```
float CalcModuleInternals::calculateResistance (
    float voltage,
    float current ) [static]
```

Function to caculate the Resistance.

Parameters

<i>voltage</i>	-> The voltage.
<i>current</i>	-> The current.

Returns

float -> The calculated resistance.

6.1.1.6 calculateStandardDeviation()

```
float CalcModuleInternals::calculateStandardDeviation (
    const float * data,
    int length ) [static]
```

Function to calculate the standard deviation of a data set.

Parameters

<i>data</i>	-> The data set to calculate the standard deviation from.
<i>length</i>	-> The length of the data set.

Returns

float -> The standard deviation of the data set.

Here is the call graph for this function:

**6.1.1.7 celsiusToFahrenheit()**

```
float CalcModuleInternals::celsiusToFahrenheit (
    float celsius ) [static]
```

Function to convert celsius to fahrenheit.

Parameters

<i>celsius</i>	-> The temperature in celsius.
----------------	--------------------------------

Returns

float -> The temperature in fahrenheit.

Here is the caller graph for this function:

**6.1.1.8 celsiusToKelvin()**

```
float CalcModuleInternals::celsiusToKelvin (
    float celsius ) [static]
```

Function to convert celsius to kelvin.

Parameters

<i>celsius</i>	-> The temperature in celsius.
----------------	--------------------------------

Returns

float -> The temperature in kelvin.

Here is the caller graph for this function:

**6.1.1.9 extractFloat()**

```
float CalcModuleInternals::extractFloat (
    String response,
    int id ) [static]
```

Extract the float from a VAT uC eth frame.

Parameters

<i>response</i>	-> The response from the VAT uC.
<i>id</i>	-> The id of the compound.

0 -> Simple GET/SET 1 -> Compound 1 1 -> Compound 2 1 -> Compound 3

Returns

float -> The extracted float.

6.1.1.10 extractFloatFromResponse()

```
float CalcModuleInternals::extractFloatFromResponse (
    const String & response,
    Type type ) [static]
```

Extract the float from a VAT uC eth frame, specific for positions and pressures.

Parameters

<i>response</i>	-> The response from the VAT uC.
<i>type</i>	-> The type to extract Pressure, Position, General

Returns

float -> The extracted float.

6.1.1.11 fahrenheitToCelsius()

```
float CalcModuleInternals::fahrenheitToCelsius (
    float fahrenheit ) [static]
```

Function to convert fahrenheit to celsius.

Parameters

<i>fahrenheit</i>	-> The temperature in fahrenheit.
-------------------	-----------------------------------

Returns

float -> The temperature in celsius.

6.1.1.12 findMaximum()

```
float CalcModuleInternals::findMaximum (
    const float * data,
    int length ) [static]
```

Function to calculate the maximum value of a data set.

Parameters

<i>data</i>	-> The data set to calculate the maximum value from.
<i>length</i>	-> The length of the data set.

Returns

float -> The maximum value of the data set.

6.1.1.13 findMedian()

```
float CalcModuleInternals::findMedian (  
    float * data,  
    int length ) [static]
```

Function to calculate the median of a data set.

Parameters

<i>data</i>	-> The data set to calculate the median from.
<i>length</i>	-> The length of the data set.

Returns

float -> The median of the data set.

6.1.1.14 findMinimum()

```
float CalcModuleInternals::findMinimum (  
    const float * data,  
    int length ) [static]
```

Function to calculate the minimum value of a data set.

Parameters

<i>data</i>	-> The data set to calculate the minimum value from.
<i>length</i>	-> The length of the data set.

Returns

float -> The minimum value of the data set.

6.1.1.15 kelvinToCelsius()

```
float CalcModuleInternals::kelvinToCelsius (  
    float kelvin ) [static]
```

Function to convert kelvin to celsius.

Parameters

<i>kelvin</i>	-> The temperature in kelvin.
---------------	-------------------------------

Returns

float -> The temperature in celsius.

6.1.1.16 pascalToAtm()

```
float CalcModuleInternals::pascalToAtm (  
    float pascal ) [static]
```

Function to convert pascal to atm.

Parameters

<i>pascal</i>	-> The pressure in pascal.
---------------	----------------------------

Returns

float -> The pressure in atm.

6.1.1.17 pascalToPsi()

```
float CalcModuleInternals::pascalToPsi (  
    float pascal ) [static]
```

Function to convert pascal to psi.

Parameters

<i>pascal</i>	-> The pressure in pascal.
---------------	----------------------------

Returns

float -> The pressure in psi.

6.1.1.18 psiToPascal()

```
float CalcModuleInternals::psiToPascal (  
    float psi ) [static]
```

Function to convert psi to pascal.

Parameters

<i>psi</i>	-> The pressure in psi.
------------	-------------------------

Returns

float -> The pressure in pascal.

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/calcModule/[calcModule.cpp](#)

6.2 calcModuleInternals Class Reference

Class for the calculation module internals.

```
#include <calcModule.h>
```

6.2.1 Detailed Description

Class for the calculation module internals.

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/calcModule/[calcModule.h](#)

6.3 comModule::ComModuleInternals Class Reference

Public Member Functions

- [EthernetCommunication](#) & [getEthernet](#) ()
Get the Ethernet object.
- [I2CCCommunication](#) & [getI2C](#) ()
Get the I2C object.
- [SPICommunication](#) & [getSPI](#) ()
Get the SPI object.
- [SerialCommunication](#) & [getSerial](#) ()
Get the Serial object.

6.3.1 Member Function Documentation

6.3.1.1 getEthernet()

`EthernetCommunication` & `ComModuleInternals::getEthernet ()`

Get the Ethernet object.

Returns

`EthernetCommunication`&

6.3.1.2 getI2C()

`I2CCommunication` & `ComModuleInternals::getI2C ()`

Get the I2C object.

Returns

`I2CCommunication`&

6.3.1.3 getSerial()

`SerialCommunication` & `ComModuleInternals::getSerial ()`

Get the Serial object.

Returns

`SerialCommunication`&

6.3.1.4 getSPI()

`SPICommunication` & `ComModuleInternals::getSPI ()`

Get the SPI object.

Returns

`SPICommunication`&

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/comModule.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/[comModule.cpp](#)

6.4 comModuleInternals Class Reference

Class for the communication module internals.

```
#include <comModule.h>
```

6.4.1 Detailed Description

Class for the communication module internals.

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/comModule.h

6.5 timeModule::DateTimeStruct Struct Reference

Struct to hold the date and time.

```
#include <timeModule.h>
```

Public Attributes

- int **year**
- int **month**
- int **day**
- int **hour**
- int **minute**
- int **second**

6.5.1 Detailed Description

Struct to hold the date and time.

The documentation for this struct was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/timeModule/timeModule.h

6.6 comModule::EthernetCommunication Class Reference

Class to handle Ethernet communication.

```
#include <ETHH.h>
```

Public Member Functions

- void [beginEthernet](#) (uint8_t *macAddress, IPAddress ip)
Function to initialize the Ethernet communication.
- void [sendEthernetData](#) (const char *endpoint, const char *data)
Function to send data over Ethernet.
- void [receiveEthernetData](#) (char *buffer, size_t length)
Function to receive data over Ethernet.
- void [handleEthernetClient](#) ()
Function to handle the Ethernet client.
- String [getRequestedEndpoint](#) ()
Function to get the requested endpoint.
- String [getSpecificEndpoint](#) (const String &jsonBody)
Function to get the specific endpoint.
- void [sendJsonResponse](#) (const String &jsonBody)
Function to send the json response with the measurment data.
- EthernetClient & [getClient](#) ()
Get the currently active Ethernet client.
- bool [isInitalized](#) () const
Function to check if the Ethernet communication is initialized.
- bool [getSendDataFlag](#) () const
Function to get the current status of the flag.
- void [setSendDataFlag](#) (bool flag)
Function to get the current status of the flag.
- void [setCompound](#) (Compound1 id, int index, String value)
Function to set a compound command for the valve uC Slave (Compound1)
- void [setCompound](#) (Compound2 id, int index, String value)
Function to set a compound command for the valve uC Slave (Compound2)
- void [setCompound](#) (Compound3 id, int index, String value)
Function to set a compound command for the valve uC Slave (Compound3)
- void [setCompoundInternal](#) (String compoundType, unsigned long id, int index, String value)
Function to set the Internal compound command for the valve uC Slave.
- String [getCompound](#) (Compound1 id, int index)
Getter for a compound command response from the valve uC Slave (Compound1)
- String [getCompound](#) (Compound2 id, int index)
Getter for a compound command response from the valve uC Slave (Compound2)
- String [getCompound](#) (Compound3 id, int index)
Getter for a compound command response from the valve uC Slave (Compound3)
- String [getCompoundInternal](#) (String compoundType, unsigned long id, int index)
Getter for the internal compound command response from the valve uC Slave.
- Vector< float > [getParsedCompound](#) (Compound1 id, int index)
Function to get a compound command response from the valve uC Slave (Compound1)
- Vector< float > [getParsedCompound](#) (Compound2 id, int index)
Function to get a compound command response from the valve uC Slave (Compound2)
- Vector< float > [getParsedCompound](#) (Compound3 id, int index)
Function to get a compound command response from the valve uC Slave (Compound3)
- Vector< float > [parseCompoundResponse](#) (String response)
Function to parse a compound response into a vector (Compound1)
- void [setParameter](#) (Compound2 id, String value)
Setter for a parameter from the VAT slave.
- String [getParameter](#) (Compound2 id)
Getter for a parameter from the VAT slave.
- void [sendCommand](#) (String command)
Helper function to send a command to the VAT slave controller.

6.6.1 Detailed Description

Class to handle Ethernet communication.

6.6.2 Member Function Documentation

6.6.2.1 beginEthernet()

```
void EthernetCommunication::beginEthernet (
    uint8_t * macAddress,
    IPAddress ip )
```

Function to initialize the Ethernet communication.

Parameters

<i>macAddress</i>	-> The MAC address to use for the Ethernet communication
<i>ip</i>	-> The IP address to use for the Ethernet communication

6.6.2.2 getClient()

```
EthernetClient & EthernetCommunication::getClient ( )
```

Get the currently active Ethernet client.

Returns

EthernetClient& , Reference to the active Ethernet client

Here is the caller graph for this function:

6.6.2.3 getCompound() [1/3]

```
String EthernetCommunication::getCompound (
    Compound1 id,
    int index )
```

Getter for a compound command response from the valve uC Slave (Compound1)

Parameters

<i>id</i>	-> Enum ID from Compound1
<i>index</i>	-> Index of the command

Returns

String -> Response from the valve uC slave

Here is the call graph for this function:

Here is the caller graph for this function:

**6.6.2.4 getCompound() [2/3]**

```
String EthernetCommunication::getCompound (
    Compound2 id,
    int index )
```

Getter for a compound command response from the valve uC Slave (Compound2)

Parameters

<i>id</i>	-> Enum ID from Compound2
<i>index</i>	-> Index of the command

Returns

String -> Response from the valve uC slave

Here is the call graph for this function:

**6.6.2.5 getCompound() [3/3]**

```
String EthernetCommunication::getCompound (
    Compound3 id,
    int index )
```

Getter for a compound command response from the valve uC Slave (Compound3)

Parameters

<i>id</i>	-> Enum ID from Compound3
<i>index</i>	-> Index of the command

Returns

String -> Response from the valve uC slave

Here is the call graph for this function:

**6.6.2.6 getCompoundInternal()**

```
String EthernetCommunication::getCompoundInternal (
    String compoundType,
    unsigned long id,
    int index )
```

Getter for the internal compound command response from the valve uC Slave.

Parameters

<i>compoundType</i>	-> The type of the compound
<i>id</i>	-> The ID of the compound
<i>index</i>	-> The index of the compound

Returns

String -> Response from the valve uC slave

Here is the caller graph for this function:

**6.6.2.7 getParameter()**

```
String EthernetCommunication::getParameter (
    Compound2 id )
```

Getter for a parameter from the VAT slave.

Parameters

<i>id</i>	-> The ID of the parameter to get
-----------	-----------------------------------

Returns

-> String will return the value of the parameter as a string, otherwise an empty string or error message.

6.6.2.8 getParsedCompound() [1/3]

```
Vector< float > EthernetCommunication::getParsedCompound (
    Compound1 id,
    int index )
```

Function to get a compound command response from the valve uC Slave (Compound1)

Parameters

<i>id</i>	-> Enum ID from Compound1
<i>index</i>	-> Index of the command

Returns

Vector<float> -> Response from the valve uC slave

Here is the call graph for this function:

6.6.2.9 getParsedCompound() [2/3]

```
Vector< float > EthernetCommunication::getParsedCompound (
    Compound2 id,
    int index )
```

Function to get a compound command response from the valve uC Slave (Compound2)

Parameters

<i>id</i>	-> Enum ID from Compound1
<i>index</i>	-> Index of the command

Returns

Vector<float> -> Response from the valve uC slave

Here is the call graph for this function:

6.6.2.10 getParsedCompound() [3/3]

```
Vector< float > EthernetCommunication::getParsedCompound (
    Compound3 id,
    int index )
```

Function to get a compound command response from the valve uC Slave (Compound3)

Parameters

<i>id</i>	-> Enum ID from Compound1
<i>index</i>	-> Index of the command

Returns

Vector<float> -> Response from the valve uC slave

Here is the call graph for this function:

6.6.2.11 getRequestedEndpoint()

```
String EthernetCommunication::getRequestedEndpoint ( )
```

Function to get the requested endpoint.

Returns

String -> The requested endpoint

6.6.2.12 getSendDataFlag()

```
bool EthernetCommunication::getSendDataFlag ( ) const
```

Function to get the current status of the flag.

Returns

true -> if data should be sent

false -> if data should not be sent

6.6.2.13 getSpecificEndpoint()

```
String EthernetCommunication::getSpecificEndpoint (
    const String & jsonBody )
```

Function to get the specific endpoint.

Parameters

<i>jsonBody</i>	-> The json body to get the endpoint from
-----------------	---

Returns

String -> The specific endpoint

6.6.2.14 isInitialized()

```
bool EthernetCommunication::isInitialized ( ) const
```

Function to check if the Ethernet communication is initialized.

Returns

true -> if the Ethernet communication is initialized
false -> if the Ethernet communication is not initialized

6.6.2.15 parseCompoundResponse()

```
Vector< float > EthernetCommunication::parseCompoundResponse (
    String response )
```

Function to parse a compound response into a vector (Compound1)

Parameters

<i>response</i>	-> Raw response string containing IEEE-754 hex values.
-----------------	--

Returns

Vector<float> -> containing parsed float values.

Here is the caller graph for this function:

6.6.2.16 receiveEthernetData()

```
void EthernetCommunication::receiveEthernetData (
    char * buffer,
    size_t length )
```

Function to receive data over Ethernet.

Parameters

<i>buffer</i>	-> The buffer to read the data into
<i>length</i>	-> The length of the data to read

6.6.2.17 sendCommand()

```
void EthernetCommunication::sendCommand (
    String command )
```

Helper function to send a command to the VAT slave controller.

Parameters

<i>command</i>	-> The command to send to the VAT slave controller
----------------	--

Here is the caller graph for this function:

6.6.2.18 sendEthernetData()

```
void EthernetCommunication::sendEthernetData (
    const char * endpoint,
    const char * data )
```

Function to send data over Ethernet.

Parameters

<i>endpoint</i>	-> endpoint to send data to
<i>data</i>	-> The data to send

6.6.2.19 sendJsonResponse()

```
void EthernetCommunication::sendJsonResponse (
    const String & jsonBody )
```

Function to send the json response with the measurment data.

Parameters

<i>jsonBody</i>	-> jsonstring with the content needed
-----------------	---------------------------------------

Here is the call graph for this function:

**6.6.2.20 setCompound() [1/3]**

```
void EthernetCommunication::setCompound (
    Compound1 id,
    int index,
    String value )
```

Function to set a compound command for the valve uC Slave (Compound1)

Parameters

<i>id</i>	-> Enum ID from Compound1
<i>index</i>	-> Index of the command
<i>value</i>	-> Value of the command

Here is the call graph for this function:

**6.6.2.21 setCompound() [2/3]**

```
void EthernetCommunication::setCompound (
```

```
Compound2 id,
int index,
String value )
```

Function to set a compound command for the valve uC Slave (Compound2)

Parameters

<i>id</i>	-> Enum ID from Compound2
<i>index</i>	-> Index of the command
<i>value</i>	-> Value of the command

Here is the call graph for this function:

6.6.2.22 setCompound() [3/3]

```
void EthernetCommunication::setCompound (
    Compound3 id,
    int index,
    String value )
```

Function to set a compound command for the valve uC Slave (Compound3)

Parameters

<i>id</i>	-> Enum ID from Compound3
<i>index</i>	-> Index of the command
<i>value</i>	-> Value of the command

Here is the call graph for this function:

6.6.2.23 setCompoundInternal()

```
void EthernetCommunication::setCompoundInternal (
```

```
String compoundType,
unsigned long id,
int index,
String value )
```

Function to set the Internal compound command for the valve uC Slave.

Parameters

<i>compoundType</i>	-> The type of the compound
<i>id</i>	-> The ID of the compound
<i>index</i>	-> The index of the compound
<i>value</i>	-> The value of the compound

Here is the caller graph for this function:

6.6.2.24 setParameter()

```
void EthernetCommunication::setParameter (
    Compound2 id,
    String value )
```

Setter for a parameter from the VAT slave.

Parameters

<i>id</i>	-> The ID of the parameter to set
<i>value</i>	-> The value to set the parameter to

Here is the call graph for this function:

6.6.2.25 setSendDataFlag()

```
void EthernetCommunication::setSendDataFlag (
    bool flag )
```

Function to get the current status of the flag.

Parameters

<i>flag</i>	-> set the flag to true if data sent, false otherwise
-------------	---

6.7 flybackModule::Flyback Class Reference

[Flyback](#) class to manage the [Flyback](#) system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes.

```
#include <flyback.h>
```

Public Member Functions

- void **initialize** ()
Initialize the [Flyback](#) system This method sets up the pins and prepares the system for operation.
- void **deinitialize** ()
denitalize the [Flyback](#) System This method shuts down the pins and prepares graceful restart.
- bool **isInitialized** () const
Get the state of the [Flyback](#) system.
- bool **getTimerState** ()
Returns the state of the timer.
- void **setTimerState** (bool state)
Sets the state of the timer.
- [SwitchStates](#) **getSwitchState** ()
Get the state of the Main-Switch.

- [Measurement measure](#) ()
Measures the voltage, current, power, digitalValue and frequency of the system.
- void **run** ()
Executes logic depending on which Main-Switch state is active.
- void [setExternFrequency](#) (uint32_t frequency)
Function to get the desired Frequency from HAS.
- uint32_t **getExternFrequency** ()
Getter Function to get the Frequency.
- void [setExternDutyCycle](#) (int dutyCycle)
Function to get the desired DutyCycle from HAS.
- int **getExternDutyCycle** ()
*Getter Function to get the DutyCycle *.*

6.7.1 Detailed Description

[Flyback](#) class to manage the [Flyback](#) system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes.

6.7.2 Member Function Documentation

6.7.2.1 getSwitchState()

```
SwitchStates Flyback::getSwitchState ( )
```

Get the state of the Main-Switch.

Returns

Enum -> The current state of the Main-Switch (e.g., "HV_Module OFF", "HV_Module MANUAL", "HV_Module REMOTE", "Invalid Switch Position")

6.7.2.2 getTimerState()

```
bool Flyback::getTimerState ( )
```

Returns the state of the timer.

Returns

true -> if the timer is initialized
false -> if the timer is not initialized

Here is the caller graph for this function:

6.7.2.3 isInitialized()

```
bool Flyback::isInitialized ( ) const
```

Get the state of the [Flyback](#) system.

Returns

true -> [Flyback](#) is initialized
false -> [Flyback](#) is not initialized

6.7.2.4 measure()

```
Measurement Flyback::measure ( )
```

Measures the voltage, current, power, digitalValue and frequency of the system.

Returns

[Measurement](#) -> A [Measurement](#) object containing voltage, current, and power

Here is the call graph for this function:

6.7.2.5 setExternDutyCycle()

```
void Flyback::setExternDutyCycle (
    int dutyCycle )
```

Function to get the desired DutyCycle from HAS.

Parameters

<i>dutyCycle</i>	-> the dutyCycle to change
------------------	----------------------------

6.7.2.6 setExternFrequency()

```
void Flyback::setExternFrequency (
    uint32_t frequency )
```

Function to get the desired Frequency from HAS.

Parameters

<i>frequency</i>	-> the frequency to change
------------------	----------------------------

6.7.2.7 setTimerState()

```
void Flyback::setTimerState (
    bool state )
```

Sets the state of the timer.

Parameters

<i>state</i>	-> If true, the timer will be enabled, otherwise disabled
--------------	---

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/flyback/flyback.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/flyback/flyback.cpp

6.8 comModule::I2CCommunication Class Reference

Class to handle I2C communication.

```
#include <I2CC.h>
```

Public Member Functions

- void `beginI2C` (uint8_t address)
Function to initialize the I2C communication.
- void `endI2C` ()
Function to end the I2C communication.
- void `i2cWrite` (uint8_t deviceAddress, uint8_t *data, size_t length)
Function to write data to the I2C device.
- size_t `i2cRead` (uint8_t deviceAddress, uint8_t *buffer, size_t length)
Function to read data from the I2C device.
- bool `isInitialized` () const
Function to check if the I2C communication is initialized.

6.8.1 Detailed Description

Class to handle I2C communication.

6.8.2 Member Function Documentation

6.8.2.1 `beginI2C()`

```
void I2CCommunication::beginI2C (
    uint8_t address )
```

Function to initialize the I2C communication.

Parameters

<i>address</i>	-> The address of the I2C device
----------------	----------------------------------

6.8.2.2 `i2cRead()`

```
size_t I2CCommunication::i2cRead (
    uint8_t deviceAddress,
    uint8_t * buffer,
    size_t length )
```

Function to read data from the I2C device.

Parameters

<i>deviceAddress</i>	-> The address of the I2C device
<i>buffer</i>	-> The buffer to read the data into
<i>length</i>	-> The length of the data to read

Returns

size_t -> The number of bytes read

6.8.2.3 i2cWrite()

```
void I2CCommunication::i2cWrite (
    uint8_t deviceAddress,
    uint8_t * data,
    size_t length )
```

Function to write data to the I2C device.

Parameters

<i>deviceAddress</i>	-> The address of the I2C device
<i>data</i>	-> The data to write
<i>length</i>	-> The length of the data

6.8.2.4 isInitialized()

```
bool I2CCommunication::isInitialized ( ) const
```

Function to check if the I2C communication is initialized.

Returns

true -> if the I2C communication is initialized
false -> if the I2C communication is not initialized

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/I2CC/I2CC.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/I2CC/I2CC.cpp

6.9 jsonModule::JsonModuleInternals Class Reference**Public Member Functions**

- void [createJson](#) (const char *key, const char *value)
Create a Json object with a key and a value.
- void [createJsonFloat](#) (const char *key, float value)
Create a Json Float object.
- void [createJsonInt](#) (const char *key, int value)
Create a Json Int object.
- void [createJsonString](#) (const char *key, String &value)
Create a Json String object.
- void [createJsonStringConst](#) (const char *key, const String &value)

Create a Json String Const object.

- void **sendJsonSerial** ()

Function to send the Json object over the Serial connection.

- void **sendJsonEthernet** (const char *endpoint)

Function to send the Json object over the Ethernet connection.

- String **getJSONString** () const

Get the Json String object.

- std::map< String, float > **mapJsonToDoubles** (const String &rawJson)

Map the Json object to a map of Strings and floats.

- void **clearJson** ()

Clear the Json object.

- void **printJsonDocMemory** ()

Prints information about the Json object.

Public Attributes

- size_t **jsonBuffer**

6.9.1 Member Function Documentation

6.9.1.1 createJson()

```
void JsonModuleInternals::createJson (
    const char * key,
    const char * value )
```

Create a Json object with a key and a value.

Parameters

<i>key</i>	-> The key of the Json object
<i>value</i>	-> The value of the Json object

6.9.1.2 createJsonFloat()

```
void JsonModuleInternals::createJsonFloat (
    const char * key,
    float value )
```

Create a Json Float object.

Parameters

<i>key</i>	-> The key of the Json object
<i>value</i>	-> The value of the Json object

6.9.1.3 createJsonInt()

```
void JsonModuleInternals::createJsonInt (
    const char * key,
    int value )
```

Create a Json Int object.

Parameters

<i>key</i>	-> The key of the Json object
<i>value</i>	-> The value of the Json object

6.9.1.4 createJsonString()

```
void JsonModuleInternals::createJsonString (
    const char * key,
    String & value )
```

Create a Json String object.

Parameters

<i>key</i>	-> The key of the Json object
<i>value</i>	-> The value of the Json object

6.9.1.5 createJsonStringConst()

```
void JsonModuleInternals::createJsonStringConst (
    const char * key,
    const String & value )
```

Create a Json String Const object.

Parameters

<i>key</i>	-> The key of the Json object
<i>value</i>	-> The value of the Json object

6.9.1.6 getJsonString()

```
String JsonModuleInternals::getJsonString ( ) const
```

Get the Json String object.

Returns

String -> The Json String object

Here is the call graph for this function:

Here is the caller graph for this function:

**6.9.1.7 mapJsonToDoubles()**

```
std::map< String, float > JsonModuleInternals::mapJsonToDoubles (
    const String & rawJson )
```

Map the Json object to a map of Strings and floats.

<https://github.com/mike-matera/ArduinoSTL/issues/84>

Parameters

<i>rawJson</i>	-> The raw Json object
----------------	------------------------

Returns

`std::map<String, float>` -> The mapped Json object

Here is the call graph for this function:

**6.9.1.8 sendJsonEthernet()**

```
void jsonModule::JsonModuleInternals::sendJsonEthernet (
    const char * endpoint )
```

Function to send the Json object over the Ethernet connection.

Parameters

<i>endpoint</i>	-> The endpoint to send the Json object to
-----------------	--

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/jsonModule/[jsonModule.h](#)
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/jsonModule/[jsonModule.cpp](#)

6.10 jsonModuleInternals Class Reference

Class for the JSON module internals.

```
#include <jsonModule.h>
```

6.10.1 Detailed Description

Class for the JSON module internals.

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/jsonModule/[jsonModule.h](#)

6.11 LockerBase Class Reference

Base class for the locker system.

```
#include <lockerBase.h>
```

Public Member Functions

- [locker::ScopedLock lockEthernetScoped \(\)](#)
- [locker::ScopedLock lockTemperatureScoped \(\)](#)
- [locker::ScopedLock lockSerialScoped \(\)](#)

6.11.1 Detailed Description

Base class for the locker system.

6.11.2 Member Function Documentation

6.11.2.1 lockEthernetScoped()

```
locker::ScopedLock LockerBase::lockEthernetScoped ( ) [inline]
```

Returns

[locker::ScopedLock](#)

6.11.2.2 lockSerialScoped()

```
locker::ScopedLock LockerBase::lockSerialScoped ( ) [inline]
```

Returns

[locker::ScopedLock](#)

6.11.2.3 lockTemperatureScoped()

```
locker::ScopedLock LockerBase::lockTemperatureScoped ( ) [inline]
```

Returns

[locker::ScopedLock](#)

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/lockerBase/lockerBase.h

6.12 LogManager Class Reference

Public Member Functions

- void `initSDCard` (int cs)
Function to initialize the SD card.
- void `shutdownSDCard` ()
Function to shut down the SD card.
- void `flushLogs` ()
Function to flush the current Logs in special cases.
- bool `isSDCardInitialized` () const
Function to check if the SD card is initialized.
- void `setLogFileName` (const String &fileName)
Set the Log File Name object.
- bool `writeToLogFile` (const String &logMessage)
Function to write a log message to the log file.
- void `renameFile` (const String &oldName, const String &newName)
Function to rename the currently written to file.

Static Public Member Functions

- static LogManager * `getInstance` ()
Get the Instance object.
- static String `getCurrentTime` ()
Getter for the current time.

6.12.1 Member Function Documentation

6.12.1.1 getCurrentTime()

```
String LogManager::getCurrentTime ( ) [static]
```

Getter for the current time.

Returns

The current time as a String

Here is the call graph for this function:

Here is the caller graph for this function:

6.12.1.2 getInstance()

```
LogManager * LogManager::getInstance ( ) [static]
```

Get the Instance object.

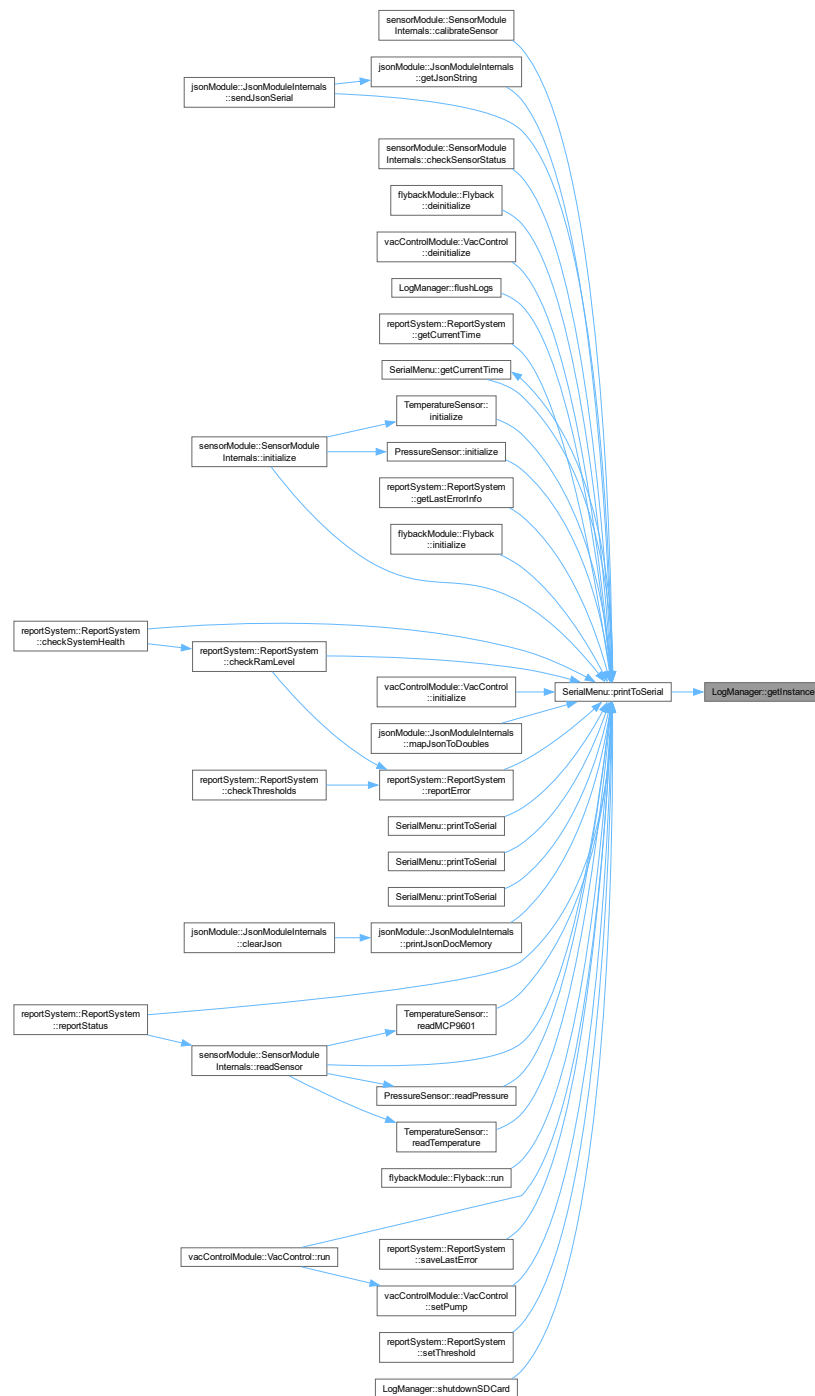

Returns

LogManager*

Here is the call graph for this function:

Here is the caller graph for this function:

6.12.1.3 initSDCard()

```
void LogManager::initSDCard (
    int cs )
```

Function to initialize the SD card.

6.12.1.5 renameFile()

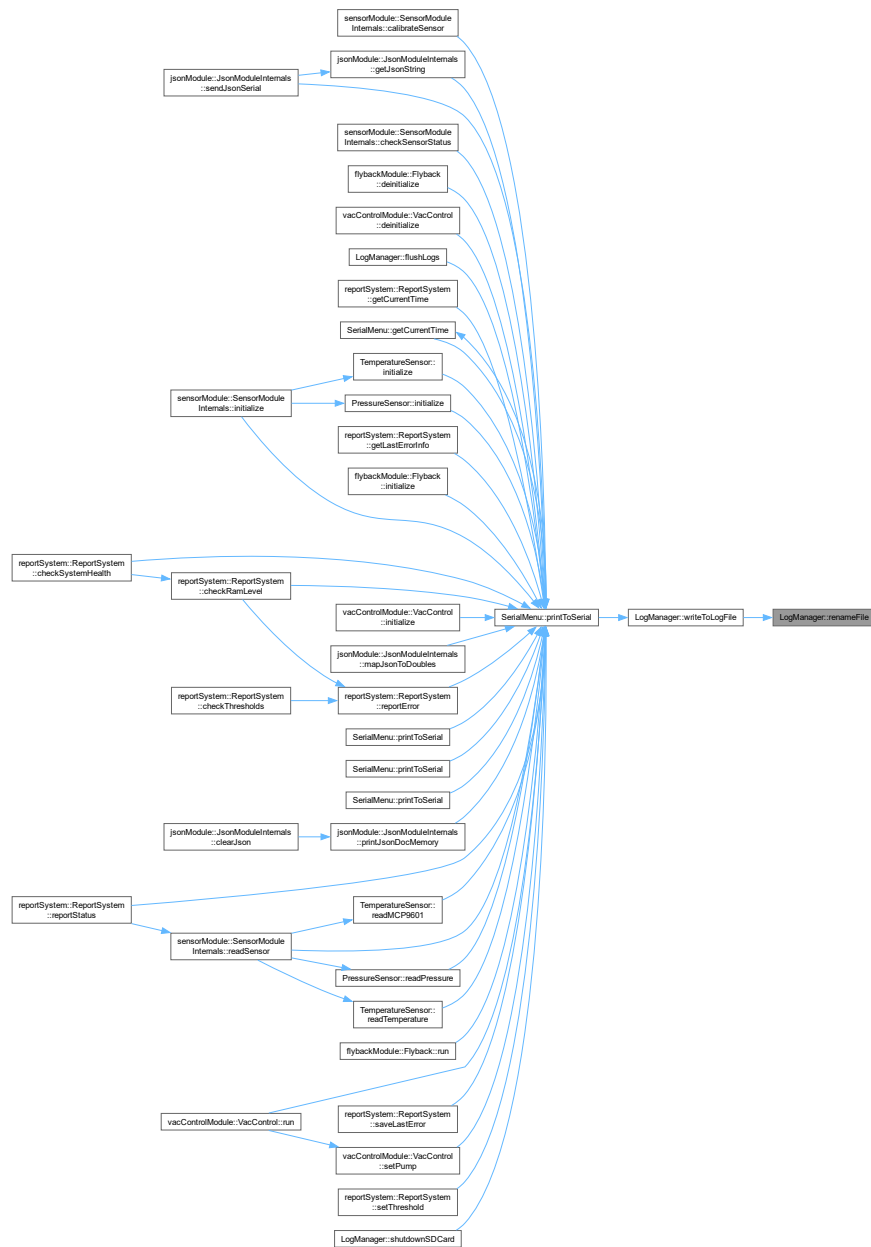

```
void LogManager::renameFile (
    const String & oldName,
    const String & newName )
```

Function to rename the currently written to file.

Parameters

<i>oldName</i>	-> This is the oldName of the file
<i>newName</i>	-> This is the newName of the file

Here is the caller graph for this function:

6.12.1.6 setLogFileName()

```
void LogManager::setLogFileName (
    const String & fileName )
```

Set the Log File Name object.

Parameters

<i>fileName</i>	-> The file name to set the log file name to.
-----------------	---

Here is the call graph for this function:

6.12.1.7 writeToLogFile()

```
bool LogManager::writeToLogFile (
    const String & logMessage )
```

Function to write a log message to the log file.

Parameters

<i>logMessage</i>	-> The log message to write to the log file.
-------------------	--

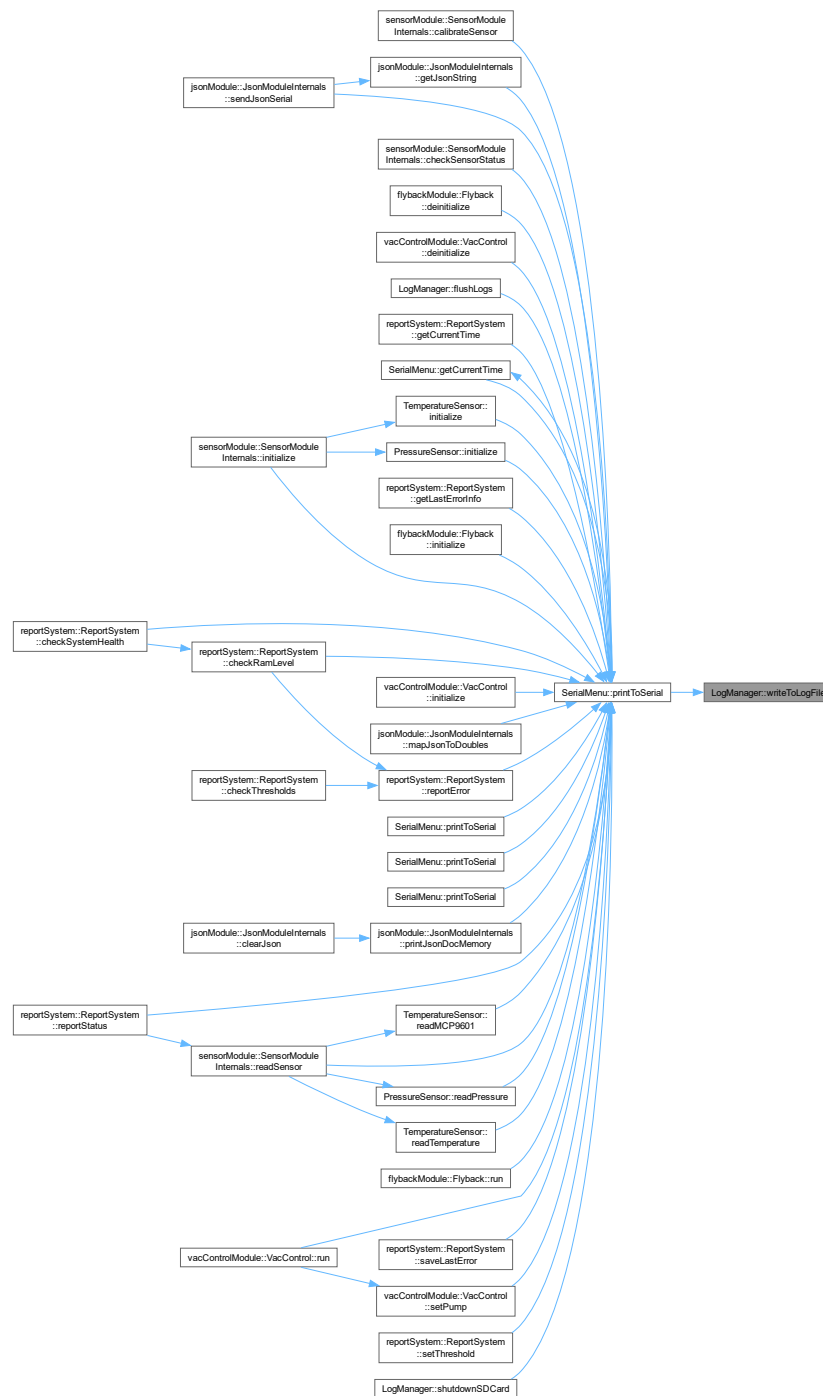

Returns

true -> if the log message was written successfully
false -> if the log message was not written successfully

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/logManager/logManager.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/logManager/logManager.cpp

6.13 LogMapper Class Reference

Class which handle the printed log messages, maps aka parses them and saves them to the SD card.

```
#include <logManager.h>
```

6.13.1 Detailed Description

Class which handle the printed log messages, maps aka parses them and saves them to the SD card.

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/logManager/logManager.h

6.14 flybackModule::Measurement Struct Reference

Structure to store the measured values of the system This structure holds the voltage, current, power, frequency and dutycycle values measured from the system.

```
#include <flyback.h>
```

Public Attributes

- float **voltage**
- float **current**
- float **power**
- int **digitalFreqValue**
- int **digitalDutyValue**
- int **dutyCycle**
- uint32_t **frequency**

6.14.1 Detailed Description

Structure to store the measured values of the system This structure holds the voltage, current, power, frequency and dutycycle values measured from the system.

The documentation for this struct was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/flyback/flyback.h

6.15 Measurement Struct Reference

Structure to store the measured values of the system This structure holds the pressure values measured from the system.

```
#include <vacControl.h>
```

6.15.1 Detailed Description

Structure to store the measured values of the system This structure holds the pressure values measured from the system.

The documentation for this struct was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/vacControl/vacControl.h

6.16 MenuItem Struct Reference

Serial menu structure.

```
#include <serialMenu.h>
```

Public Attributes

- const char * **label**
- char **key**
- void(* **callback**)()

6.16.1 Detailed Description

Serial menu structure.

The documentation for this struct was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/serialMenu/serialMenu.h

6.17 Outputlevel Class Reference

Enum Class for the differnet Outputlevels.

```
#include <serialMenu.h>
```

6.17.1 Detailed Description

Enum Class for the differnet Outputlevels.

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/serialMenu/serialMenu.h

6.18 PointerWrapper< T > Class Template Reference

Tempalte class for wrapping a pointer.

```
#include <ptrUtils.h>
```

Public Member Functions

- **PointerWrapper** (T *p=nullptr)
- T * **get** () const
Function to get the pointer.
- T * **release** ()
Function to release the pointer.
- void **reset** (T *p=nullptr)
Function to reset the pointer.
- T & **operator*** ()
Operator to dereference the pointer.
- T * **operator->** ()
Operator to access the pointer.

6.18.1 Detailed Description

```
template<typename T>
class PointerWrapper< T >
```

Tempalte class for wrapping a pointer.

Template Parameters

<i>T</i>	
----------	--

6.18.2 Member Function Documentation

6.18.2.1 get()

```
template<typename T >
T * PointerWrapper< T >::get ( ) const [inline]
```

Function to get the pointer.

Returns

T* -> The pointer.

6.18.2.2 operator*()

```
template<typename T >
T & PointerWrapper< T >::operator* ( ) [inline]
```

Operator to dereference the pointer.

Returns

T& -> The dereferenced pointer.

6.18.2.3 operator->()

```
template<typename T >
T * PointerWrapper< T >::operator-> ( ) [inline]
```

Operator to access the pointer.

Returns

T* -> The pointer.

6.18.2.4 release()

```
template<typename T >
T * PointerWrapper< T >::release ( ) [inline]
```

Function to release the pointer.

Returns

T* -> The released pointer.

6.18.2.5 reset()

```
template<typename T >
void PointerWrapper< T >::reset (
    T * p = nullptr ) [inline]
```

Function to reset the pointer.

Parameters

<i>p</i>	-> The pointer to reset to.
----------	-----------------------------

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/ptrUtils/ptrUtils.h

6.19 vacControlModule::Pressure Struct Reference

Public Attributes

- float **pressure**

The documentation for this struct was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/vacControl/vacControl.h

6.20 PressureSensor Class Reference

Pressure sensor class.

```
#include <pressure.h>
```

Inheritance diagram for PressureSensor:

Public Member Functions

- void **initialize** ()
Function to initialize the pressure sensor.
- float **readPressure** ()
Function to read the pressure from the sensor.
- bool **isInitialized** () const
Function to check if the pressure sensor is initialized.

6.20.1 Detailed Description

Pressure sensor class.

6.20.2 Member Function Documentation

6.20.2.1 isInitialized()

```
bool PressureSensor::isInitialized ( ) const
```

Function to check if the pressure sensor is initialized.

Returns

true -> if the pressure sensor is initialized

false -> if the pressure sensor is not initialized

Here is the caller graph for this function:

6.20.2.2 readPressure()

```
float PressureSensor::readPressure ( )
```

Function to read the pressure from the sensor.

Returns

float -> The pressure value.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/pressure/pressure.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/pressure/[pressure.cpp](#)

6.21 PtrUtils Class Reference

Utility class for pointer operations.

```
#include <ptrUtils.h>
```

Static Public Member Functions

- `template<typename T >`
static bool [IsNullPtr](#) (T *ptr)
- `template<typename T >`
static bool [IsValidPtr](#) (T *ptr)

6.21.1 Detailed Description

Utility class for pointer operations.

6.21.2 Member Function Documentation

6.21.2.1 IsNullPtr()

```
template<typename T >  
static bool PtrUtils::IsNullPtr (  
    T * ptr ) [inline], [static]
```

Check if a pointer is nullptr.

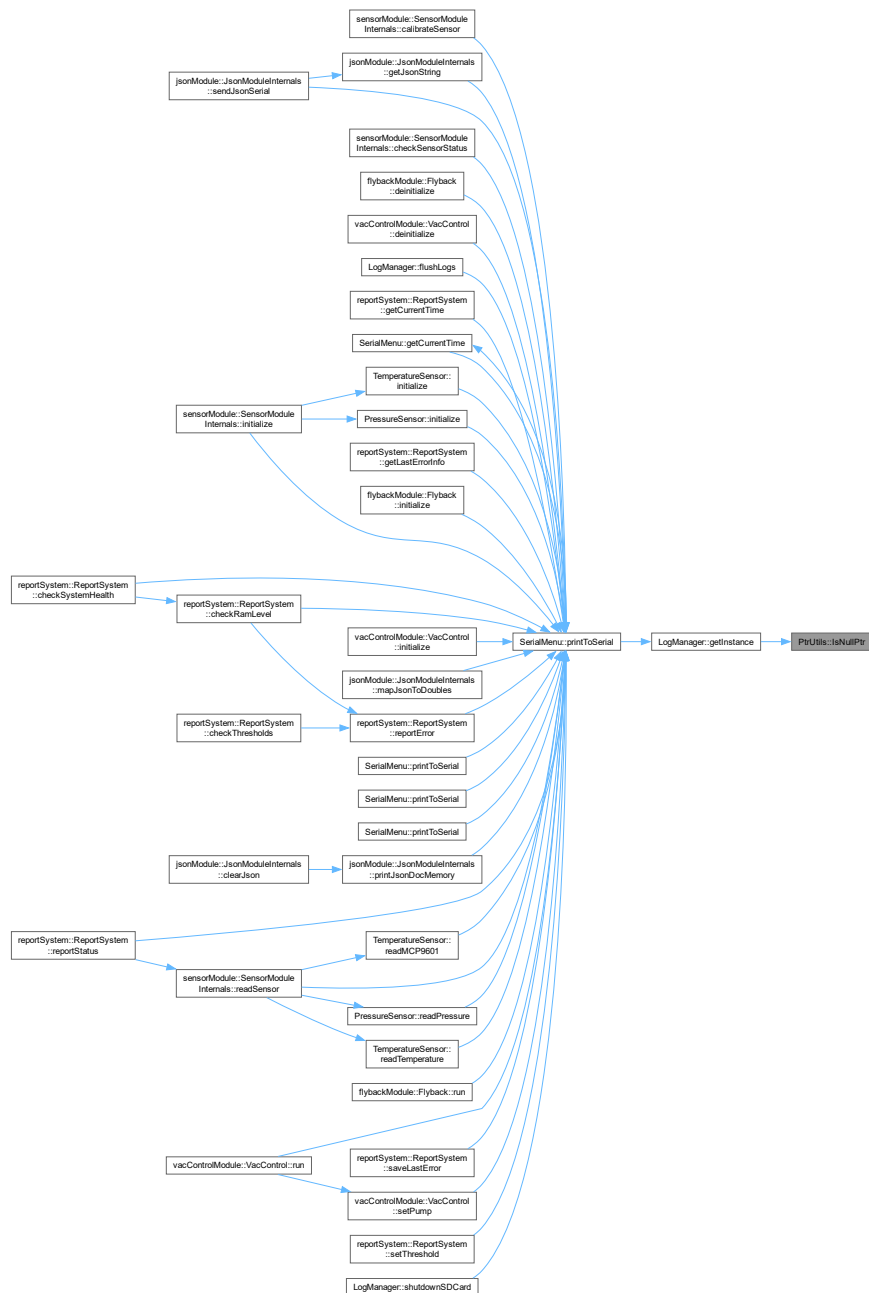

Parameters

<i>ptr</i>	Pointer to check.
------------	-------------------

Returns

true if the pointer is nullptr, false otherwise.

Here is the caller graph for this function:

6.21.2.2 IsValidPtr()

```

template<typename T >
static bool PtrUtils::IsValidPtr (
    T * ptr ) [inline], [static]

```

Check if a pointer is valid (not nullptr).

Parameters

<i>ptr</i>	Pointer to check.
------------	-------------------

Returns

true if the pointer is not nullptr, false otherwise.

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/ptrUtils/ptrUtils.h

6.22 reportSystem::ReportSystem Class Reference

Class for the report system.

```
#include <reportSystem.h>
```

Public Member Functions

- void **reportError** (const char *errorMessage)
Function to log an error message.
- bool **checkSystemHealth** (size_t memoryThreshold, bool checkEth, bool checkSpi, bool checkI2c, bool checkTemp, bool checkPress)
Function to check the system health of the uC.
- String **reportStatus** (bool active)
Function to report the status of the system.
- void **setThreshold** (float tempThreshold, float pressureThreshold)
Set Thresholds for the pressure and temperature sensors.
- bool **checkThresholds** (float currentTemp, float currentPressure)
Check the thresholds for the temperature and pressure sensors.
- String **getCurrentTime** ()
Get the Current Time of the system.
- String **getMemoryStatus** ()
Get the Memory Status of the system.
- String **getStackDump** ()
Get the Stack Dump of the system.
- void **startBusyTime** ()
For Stack Guarding.
- void **startIdleTime** ()
For Stack Guarding.
- float **getCPULoad** ()
Getter for the CPU Load.
- void **resetUsage** ()
Start the CPU Load Calculation.
- void **saveLastError** (const char *error)
Saves last error message to EEPROM.
- String **getLastError** ()
Get the Last Error message from EEPROM.
- bool **getLastErrorInfo** ()
Get the Last Error message from EEPROM.
- bool **checkRamLevel** (unsigned int warningThreshold, unsigned int criticalThreshold)
Function to check the SRAM level on the hostsystem.

Static Public Member Functions

- static void **initStackGuard** ()
Initialize the Stack Guard.
- static bool **detectStackOverflow** ()
Detect Stack Overflow.

6.22.1 Detailed Description

Class for the report system.

6.22.2 Member Function Documentation

6.22.2.1 checkRamLevel()

```
bool ReportSystem::checkRamLevel (
    unsigned int warningThreshold,
    unsigned int criticalThreshold )
```

Function to check the SRAM level on the hostsystem.

Parameters

<i>warningThreshold</i>	-> first warning to get
<i>criticalThreshold</i>	-> last warning to get

Returns

true -> if the level exceeded
false -> if the levels are withing the thresholds

Here is the call graph for this function:

Here is the caller graph for this function:

6.22.2.2 checkSystemHealth()

```

bool ReportSystem::checkSystemHealth (
    size_t memoryThreshold,
    bool checkEth,
    bool checkSpi,
    bool checkI2c,
    bool checkTemp,
    bool checkPress )
  
```

Function to check the system health of the uC.

Parameters

<i>memoryThreshold</i>	-> The memory threshold to check
<i>checkEth</i>	-> Check the Ethernet connection
<i>checkSpi</i>	-> Check the SPI connection
<i>checkI2c</i>	-> Check the I2C connection
<i>checkTemp</i>	-> Check the temperature sensor
<i>checkPress</i>	-> Check the pressure sensor

Returns

true -> if the system is healthy
false -> if the system is not healthy

Here is the call graph for this function:

6.22.2.3 checkThresholds()

```
bool ReportSystem::checkThresholds (
    float currentTemp,
    float currentPressure )
```

Check the thresholds for the temperature and pressure sensors.

Parameters

<i>currentTemp</i>	-> The current temperature
<i>currentPressure</i>	-> The current pressure

Returns

true -> if the thresholds are met

false -> if the thresholds are not met

Here is the call graph for this function:

6.22.2.4 detectStackOverflow()

```
bool ReportSystem::detectStackOverflow ( ) [static]
```

Detect Stack Overflow.

Returns

true -> if the stack has overflowed

false -> if the stack has not overflowed

Here is the caller graph for this function:

6.22.2.5 getCPULoad()

```
float ReportSystem::getCPULoad ( )
```

Getter for the CPU Load.

Returns

float -> The CPU Load

6.22.2.6 getCurrentTime()

```
String ReportSystem::getCurrentTime ( )
```

Get the Current Time of the system.

Returns

String -> The current time

Here is the call graph for this function:

6.22.2.7 getLastError()

```
String ReportSystem::getLastError ( )
```

Get the Last Error message from EEPROM.

Returns

String -> The last error message

Here is the caller graph for this function:

6.22.2.8 getLastErrorInfo()

```
bool ReportSystem::getLastErrorInfo ( )
```

Get the Last Error message from EEPROM.

Returns

bool -> used by the Endpoint to report to HAS

Here is the call graph for this function:

6.22.2.9 getMemoryStatus()

```
String ReportSystem::getMemoryStatus ( )
```

Get the Memory Status of the system.

Returns

String -> The memory status

Here is the caller graph for this function:

6.22.2.10 getStackDump()

```
String ReportSystem::getStackDump ( )
```

Get the Stack Dump of the system.

Returns

String -> The stack dump

6.22.2.11 reportError()

```
void ReportSystem::reportError (
    const char * errorMessage )
```

Function to log an error message.

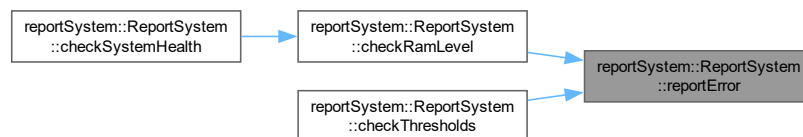

Parameters

<i>errorMessage</i>	-> The error message to log
---------------------	-----------------------------

Here is the call graph for this function:

Here is the caller graph for this function:

6.22.2.12 reportStatus()

```
String ReportSystem::reportStatus (
    bool active )
```

Function to report the status of the system.

Parameters

<i>active</i>	-> The status of the system
---------------	-----------------------------

Returns

String -> The status of the system

Here is the call graph for this function:

6.22.2.13 saveLastError()

```
void ReportSystem::saveLastError (
    const char * error )
```

Saves last error message to EEPROM.

HINT: KEEP IN MIND ~100 000 write cycles per cell!

Parameters

<i>error</i>	-> The error message to save
--------------	------------------------------

Here is the call graph for this function:

6.22.2.14 setThreshold()

```
void ReportSystem::setThreshold (
    float tempThreshold,
    float pressureThreshold )
```

Set Thresholds for the pressure and temperature sensors.

Parameters

<i>tempThreshold</i>	-> The temperature threshold
<i>pressureThreshold</i>	-> The pressure threshold

Here is the call graph for this function:

The documentation for this class was generated from the following files:

6.23 locker::ScopedLock Class Reference

Scoped lock class for mutexes.

```
#include <scopedLock.h>
```

Public Member Functions

- [ScopedLock](#) (frt::Mutex &mutex)
Construct a new Scoped Lock object.
- **ScopedLock** (const [ScopedLock](#) &)=delete
- [ScopedLock](#) & **operator=** (const [ScopedLock](#) &)=delete
- [ScopedLock](#) ([ScopedLock](#) &&other) noexcept
Construct a new Scoped Lock object.
- [ScopedLock](#) & **operator=** ([ScopedLock](#) &&)=delete

6.23.1 Detailed Description

Scoped lock class for mutexes.

6.23.2 Constructor & Destructor Documentation

6.23.2.1 ScopedLock() [1/2]

```
locker::ScopedLock::ScopedLock (
    frt::Mutex & mutex ) [inline], [explicit]
```

Construct a new Scoped Lock object.

Parameters

<i>mutex</i>	-> The mutex to lock
--------------	----------------------

6.23.2.2 ScopedLock() [2/2]

```
locker::ScopedLock::ScopedLock (
    ScopedLock && other ) [inline], [noexcept]
```

Construct a new Scoped Lock object.

Parameters

<i>other</i>	-> The other ScopedLock object to move from
--------------	---

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/lockerBase/scopedLock.h

6.24 ScopedPointer< T > Class Template Reference

Template class for a Scoped Pointer.

```
#include <ptrUtils.h>
```

Public Member Functions

- **ScopedPointer** (T *p=nullptr)
 • T * [get](#) () const
Function to get the pointer.
- T * [release](#) ()
Function to release the pointer.
- void [reset](#) (T *p=nullptr)
Function to reset the pointer.
- T & [operator*](#) () const
Operator to dereference the pointer.
- T * [operator->](#) () const
Operator to access the pointer.

6.24.1 Detailed Description

```
template<typename T>
class ScopedPointer< T >
```

Template class for a Scoped Pointer.

Template Parameters

<i>T</i>	-> The type of the pointer.
----------	-----------------------------

6.24.2 Member Function Documentation

6.24.2.1 get()

```
template<typename T >
T * ScopedPointer< T >::get ( ) const [inline]
```

Function to get the pointer.

Returns

T* -> The pointer.

6.24.2.2 operator*()

```
template<typename T >
T & ScopedPointer< T >::operator* ( ) const [inline]
```

Operator to dereference the pointer.

Returns

T& -> The dereferenced pointer.

6.24.2.3 operator->()

```
template<typename T >
T * ScopedPointer< T >::operator-> ( ) const [inline]
```

Operator to access the pointer.

Returns

T* -> The pointer.

6.24.2.4 release()

```
template<typename T >
T * ScopedPointer< T >::release ( ) [inline]
```

Function to release the pointer.

Returns

T* -> The released pointer.

6.24.2.5 reset()

```
template<typename T >
void ScopedPointer< T >::reset (
    T * p = nullptr ) [inline]
```

Function to reset the pointer.

Parameters

<i>p</i>	-> The pointer to reset to.
----------	-----------------------------

The documentation for this class was generated from the following file:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/ptrUtils/ptrUtils.h

6.25 sensorModule::SensorModuleInternals Class Reference

Class for the sensor module internals.

```
#include <sensorModule.h>
```

Inheritance diagram for sensorModule::SensorModuleInternals:

Collaboration diagram for sensorModule::SensorModuleInternals:

Public Member Functions

- void **initialize** ()
Initialize the sensors.
- float **readSensor** ([SensorType](#) type)
Function to read the sensor.
- bool **calibrateSensor** ([SensorType](#) type)
Function to calibrate the sensor.
- bool **checkSensorStatus** ([SensorType](#) type)
Function to check the status of the sensor.

Public Member Functions inherited from [TemperatureSensor](#)

- void **initialize** ()
Function to initialize the temperature sensor.
- float **readTemperature** ()
Function to read the temperature from the sensor.
- float **readMCP9601** (Units unit)
Function to read form specific sensor MCP9601.
- bool **isInitialized** () const
Check if the temperature sensor is initialized.
- uint8_t **calibMCP9601** ()
Method to calibrate the MCP9601 sensor.

Public Member Functions inherited from [PressureSensor](#)

- void **initialize** ()
Function to initialize the pressure sensor.
- float **readPressure** ()
Function to read the pressure from the sensor.
- bool **isInitialized** () const
Function to check if the pressure sensor is initialized.

6.25.1 Detailed Description

Class for the sensor module internals.

6.25.2 Member Function Documentation

6.25.2.1 **calibrateSensor()**

```
bool SensorModuleInternals::calibrateSensor (
    SensorType type )
```

Function to calibrate the sensor.

Parameters

<i>type</i>	-> The type of the sensor to calibrate.
-------------	---

Returns

true -> if the sensor was calibrated successfully
false -> if the sensor was not calibrated successfully

Here is the call graph for this function:

6.25.2.2 checkSensorStatus()

```
bool SensorModuleInternals::checkSensorStatus (
    SensorType type )
```

Function to check the status of the sensor.

Parameters

<i>type</i>	-> The type of the sensor to check.
-------------	-------------------------------------

Returns

true -> if the sensor is healthy
false -> if the sensor is not healthy

Here is the call graph for this function:

6.25.2.3 readSensor()

```
float SensorModuleInternals::readSensor (
    SensorType type )
```

Function to read the sensor.

Parameters

<i>type</i>	-> The type of the sensor to read.
-------------	------------------------------------

Returns

float -> The value of the sensor.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/sensorModule/[sensorModule.h](#)
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/sensorModule/sensorModule.cpp

6.26 comModule::SerialCommunication Class Reference

Class to handle Serial communication.

```
#include <SER.h>
```

Public Member Functions

- void `beginSerial` (long baudRate)
Function to start the serial communication.
- void `endSerial` ()
Function to end the serial communication.
- void `sendSerialData` (const char *data)
Function to end the serial communication.
- void `receiveSerialData` (char *buffer, size_t length)
Function to receive data over serial.
- bool `isInitialized` () const
Function to check if the serial communication is initialized.

6.26.1 Detailed Description

Class to handle Serial communication.

6.26.2 Member Function Documentation

6.26.2.1 `beginSerial()`

```
void SerialCommunication::beginSerial (
    long baudRate )
```

Function to start the serial communication.

Parameters

<i>baudRate</i>	-> The baud rate to use for the serial communication
-----------------	--

6.26.2.2 `isInitialized()`

```
bool SerialCommunication::isInitialized ( ) const
```

Function to check if the serial communication is initialized.

Returns

true -> if the serial communication is initialized
false -> if the serial communication is not initialized

6.26.2.3 `receiveSerialData()`

```
void SerialCommunication::receiveSerialData (
    char * buffer,
    size_t length )
```

Function to receive data over serial.

Parameters

<i>buffer</i>	-> The buffer to read the data into
<i>length</i>	-> The length of the data to read

6.26.2.4 sendSerialData()

```
void SerialCommunication::sendSerialData (  
    const char * data )
```

Function to end the serial communication.

Parameters

<i>data</i>	-> The data to send
-------------	---------------------

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/SER/SER.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/SER/SER.cpp

6.27 SerialMenu Class Reference

Class for the serial menu.

```
#include <serialMenu.h>
```

Public Types

- enum class **OutputLevel** {
 DEBUG , **INFO** , **WARNING** , **ERROR** ,
 CRITICAL , **STATUS** , **PLAIN** }

Public Member Functions

- void **load** ([MenuItem](#) *items, size_t size)
 Function to load the menu items.
- void **show** ()
 Function to show the menu.
- void **run** ()
 Function to run the menu.

Static Public Member Functions

- static void [printToSerial](#) (OutputLevel level, const String &message, bool newLine=true, bool logMessage=false)
Function to print a message to the serial port, using mutexes, output level and new line options.
- static void [printToSerial](#) (OutputLevel level, const __FlashStringHelper *message, bool newLine=true, bool logMessage=false)
Function to print a message to the serial port, using mutexes, output level and new line options.
- static void [printToSerial](#) (const String &message, bool newLine=true, bool logMessage=false)
Function to print a message to the serial port, using mutexes, output level and new line options.
- static void [printToSerial](#) (const __FlashStringHelper *message, bool newLine=true, bool logMessage=false)
Function to print a message to the serial port, using mutexes, output level and new line options.
- static String [getCurrentTime](#) ()
Getter for the current time.

6.27.1 Detailed Description

Class for the serial menu.

6.27.2 Member Function Documentation

6.27.2.1 getCurrentTime()

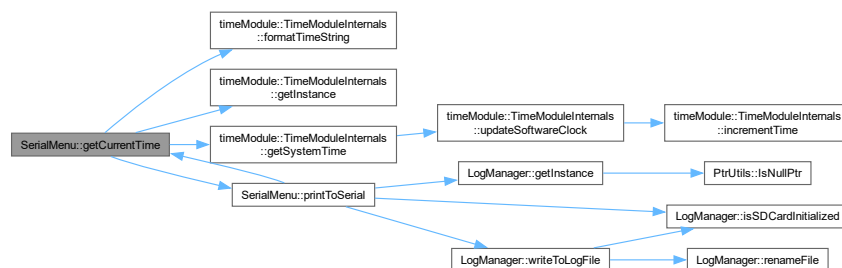

```
String SerialMenu::getCurrentTime ( ) [static]
```

Getter for the current time.

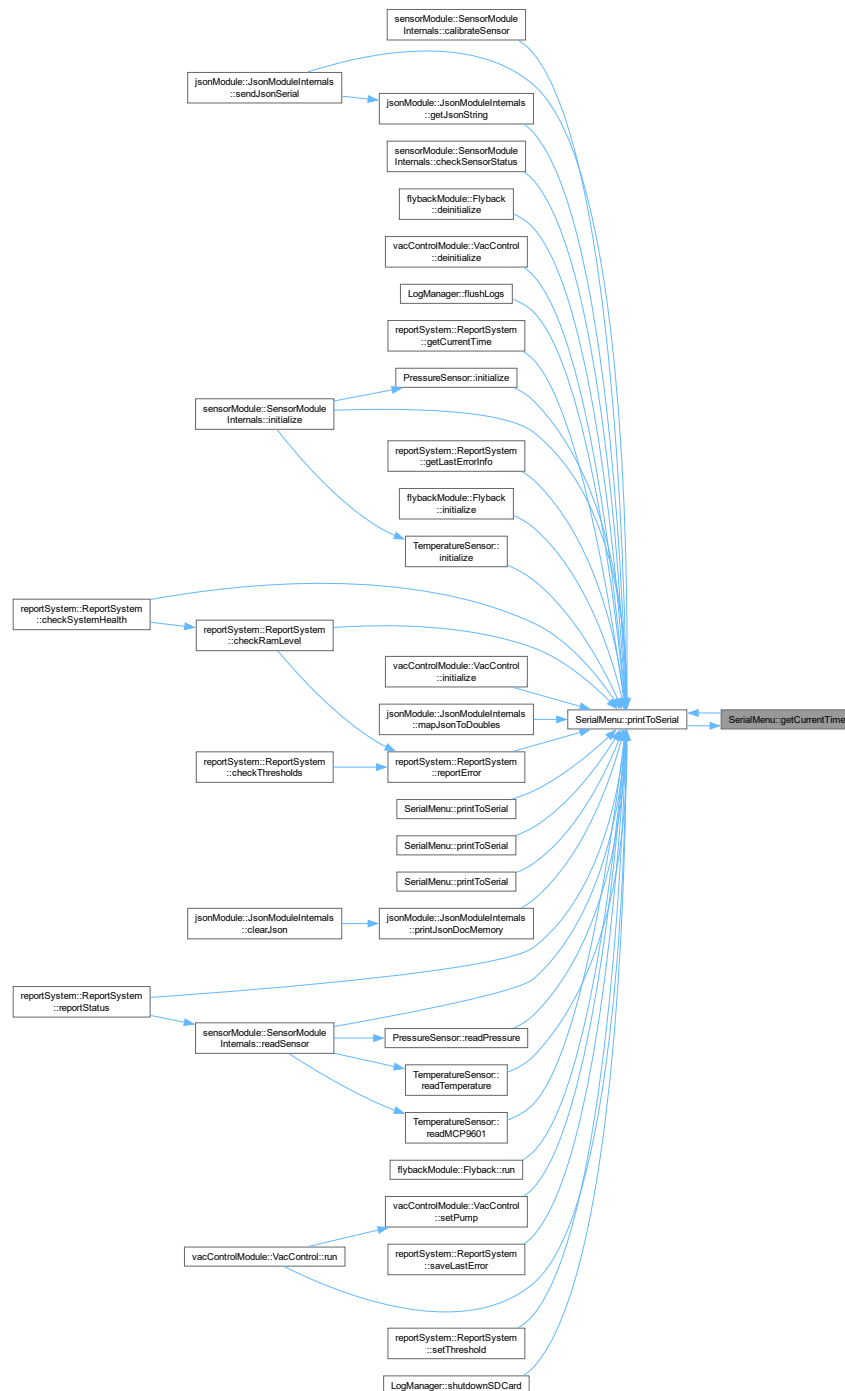

Returns

The current time as a String

Here is the call graph for this function:

Here is the caller graph for this function:

6.27.2.2 load()

```
void SerialMenu::load (
    MenuItem * items,
    size_t size )
```

Function to load the menu items.

Parameters

<i>items</i>	-> The menu items.
<i>size</i>	-> The size of the menu items.

6.27.2.3 printToSerial() [1/4]

```
void SerialMenu::printToSerial (
    const __FlashStringHelper * message,
    bool newLine = true,
    bool logMessage = false ) [static]
```

Function to print a message to the serial port, using mutexes, output level and new line options.

Parameters

<i>message</i>	-> The message to print, a __FlashStringHelper pointer.
<i>newLine</i>	-> Whether to add a new line at the end of the message.

Here is the call graph for this function:

6.27.2.4 printToSerial() [2/4]

```
void SerialMenu::printToSerial (
    const String & message,
    bool newLine = true,
    bool logMessage = false ) [static]
```

Funtion to print a message to the serial port, using mutexes, output level and new line options.

Parameters

<i>message</i>	-> The message to print, a String object.
<i>newLine</i>	-> Whether to add a new line at the end of the message.

Here is the call graph for this function:

6.27.2.5 printToSerial() [3/4]

```

void SerialMenu::printToSerial (
    OutputLevel level,
    const __FlashStringHelper * message,
    bool newLine = true,
    bool logMessage = false ) [static]
  
```

Function to print a message to the serial port, using mutexes, output level and new line options.

Parameters

<i>level</i>	-> The output level of the message.
<i>message</i>	-> The message to print, a __FlashStringHelper pointer.
<i>newLine</i>	-> Whether to add a new line at the end of the message.

Here is the call graph for this function:

6.27.2.6 printToSerial() [4/4]

```

void SerialMenu::printToSerial (
    OutputLevel level,
    const String & message,
    bool newLine = true,
    bool logMessage = false ) [static]
  
```

Function to print a message to the serial port, using mutexes, output level and new line options.

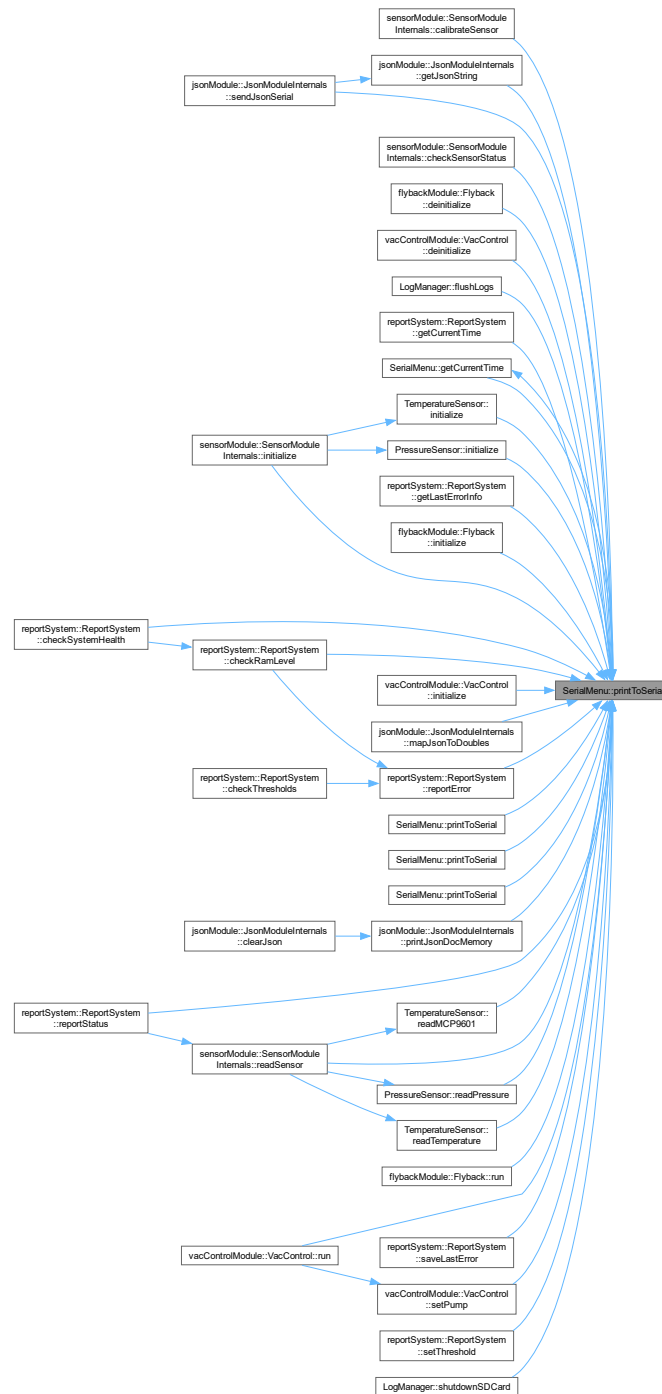

Parameters

<i>level</i>	-> The output level of the message.
<i>message</i>	-> The message to print, a String object.
<i>newLine</i>	-> Whether to add a new line at the end of the message.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/serialMenu/serialMenu.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/serialMenu/serialMenu.cpp

6.28 comModule::SPICommunication Class Reference

Class to handle SPI communication.

```
#include <SPII.h>
```

Public Member Functions

- void **beginSPI** ()
Function to initialize the SPI communication.
- void **endSPI** ()
Function to end the SPI communication.
- void **spiWrite** (uint8_t *data, size_t length)
Function to write data over SPI.
- void **spiRead** (uint8_t *buffer, size_t length)
Function to read data over SPI.
- bool **isInitialized** () const
Function to check if the SPI communication is initialized.

6.28.1 Detailed Description

Class to handle SPI communication.

6.28.2 Member Function Documentation

6.28.2.1 isInitialized()

```
bool SPICommunication::isInitialized ( ) const
```

Function to check if the SPI communication is initialized.

Returns

- true -> if the SPI communication is initialized
- false -> if the SPI communication is not initialized

6.28.2.2 spiRead()

```
void SPICommunication::spiRead (
    uint8_t * buffer,
    size_t length )
```

Function to read data over SPI.

Parameters

<i>buffer</i>	-> The buffer to read the data into
<i>length</i>	-> The length of the data to read

6.28.2.3 spiWrite()

```
void SPICommunication::spiWrite (
    uint8_t * data,
    size_t length )
```

Function to write data over SPI.

Parameters

<i>data</i>	-> The data to write
<i>length</i>	-> The length of the data

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/SPII/SPII.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/comModule/SPII/SPII.cpp

6.29 TemperatureSensor Class Reference

Temperature sensor class.

```
#include <temperature.h>
```

Inheritance diagram for TemperatureSensor:

Public Member Functions

- void **initialize** ()
Function to initialize the temperature sensor.
- float **readTemperature** ()
Function to read the temperature from the sensor.
- float **readMCP9601** (Units unit)
Function to read form specific sensor MCP9601.
- bool **isInitialized** () const
Check if the temperature sensor is initialized.
- uint8_t **calibMCP9601** ()
Method to calibrate the MCP9601 sensor.

6.29.1 Detailed Description

Temperature sensor class.

6.29.2 Member Function Documentation

6.29.2.1 calibMCP9601()

```
uint8_t TemperatureSensor::calibMCP9601 ( )
```

Method to calibrate the MCP9601 sensor.

Returns

uint8_t -> the status of the calibration

Here is the caller graph for this function:

6.29.2.2 isInitialized()

```
bool TemperatureSensor::isInitialized ( ) const
```

Check if the temperature sensor is initialized.

Returns

true -> if the temperature sensor is initialized

false -> if the temperature sensor is not initialized

Here is the caller graph for this function:

6.29.2.3 readMCP9601()

```
float TemperatureSensor::readMCP9601 (
    Units unit )
```

Function to read form specific sensor MCP9601.

Parameters

<i>unit</i>	-> Choose the unit °C, F, K
-------------	-----------------------------

Returns

-> The temperature value

Here is the call graph for this function:

Here is the caller graph for this function:

6.29.2.4 readTemperature()

```
float TemperatureSensor::readTemperature ( )
```

Function to read the temperature from the sensor.

Returns

float -> The temperature value.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/temperature/temperature.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/temperature/temperature.cpp

6.30 timeModule::TimeModuleInternals Class Reference

Class to handle Systemtime.

```
#include <timeModule.h>
```

Public Member Functions

- bool [setTimeFromHas](#) (const String &timeString)
Set the Time From Has object to the system time.
- void [setSystemTime](#) (const [DateTimeStruct](#) &dt)
Set the System Time object of the system.
- void **updateSoftwareClock** ()
Updates the software clock.
- [DateTimeStruct](#) [getSystemTime](#) ()
Get the System Time object.

Static Public Member Functions

- static void [incrementTime](#) ([DateTimeStruct](#) *dt)
Function to increment the time of the system.
- static String [formatTimeString](#) (const [DateTimeStruct](#) &dt)
Function to format the time to a string.
- static [TimeModuleInternals](#) * [getInstance](#) ()
Get the Instance object, Singleton pattern.

6.30.1 Detailed Description

Class to handle Systemtime.

6.30.2 Member Function Documentation

6.30.2.1 formatTimeString()

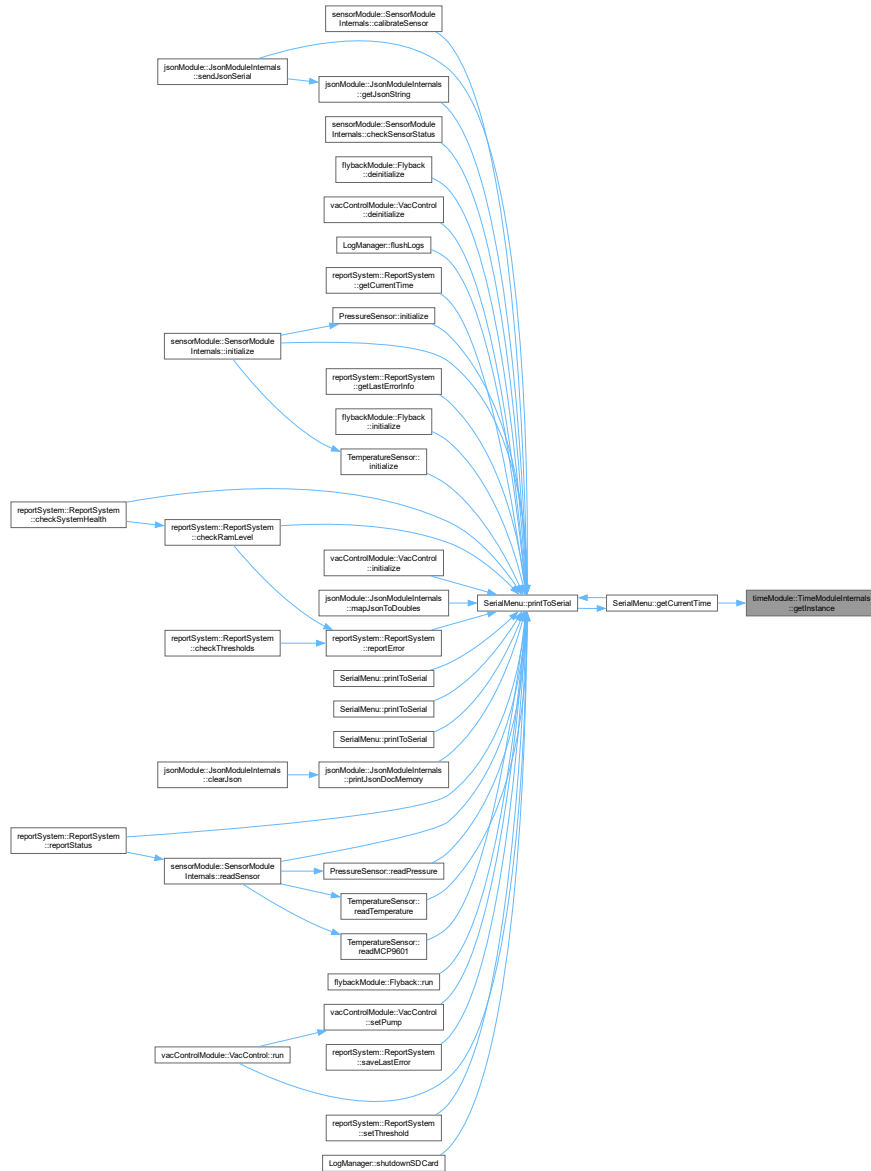

```
String TimeModuleInternals::formatTimeString (
    const DateTimeStruct & dt ) [static]
```

Function to format the time to a string.

Returns

TimeModuleInternals* -> The instance of the [TimeModuleInternals](#).

Here is the caller graph for this function:

6.30.2.3 getSystemTime()

```
DateTimeStruct TimeModuleInternals::getSystemTime ( )
```

Get the System Time object.

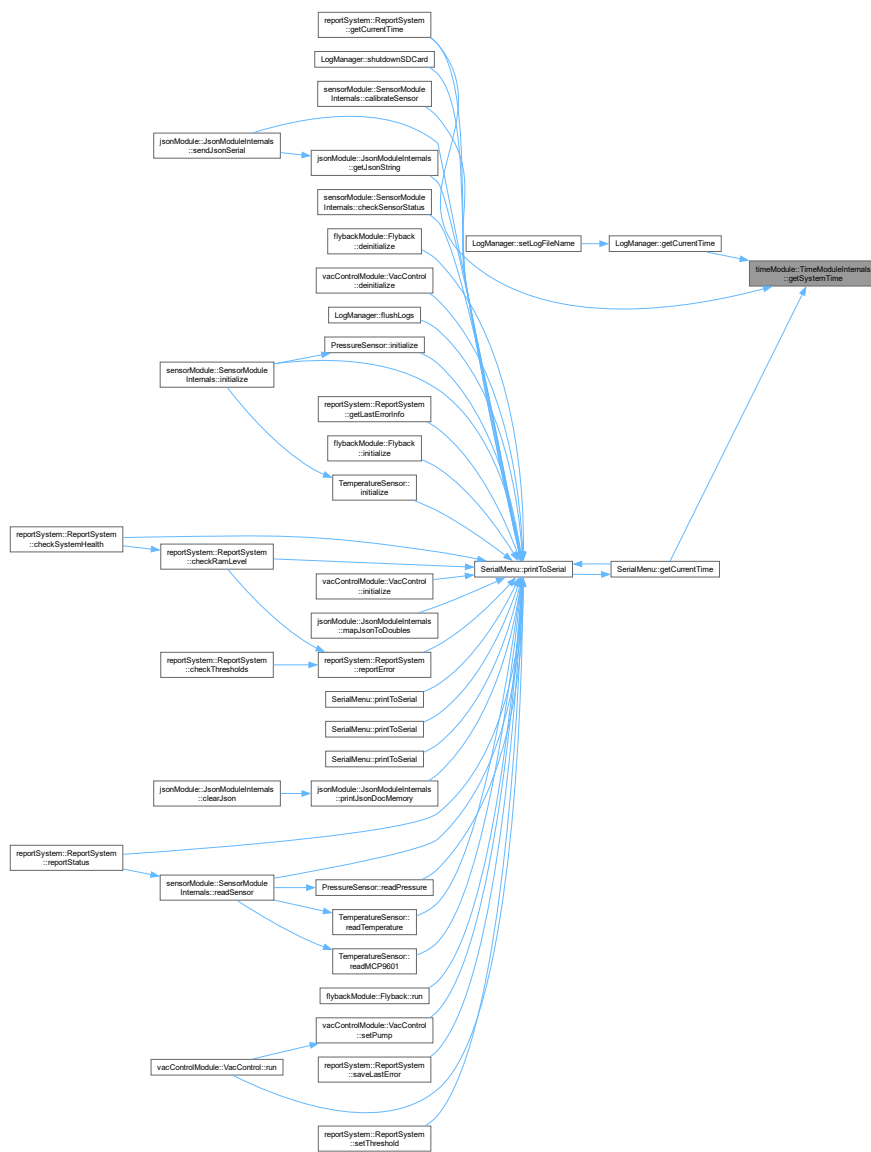

Returns

`DateTimeStruct` -> The system time.

Here is the call graph for this function:

Here is the caller graph for this function:

6.30.2.4 incrementTime()

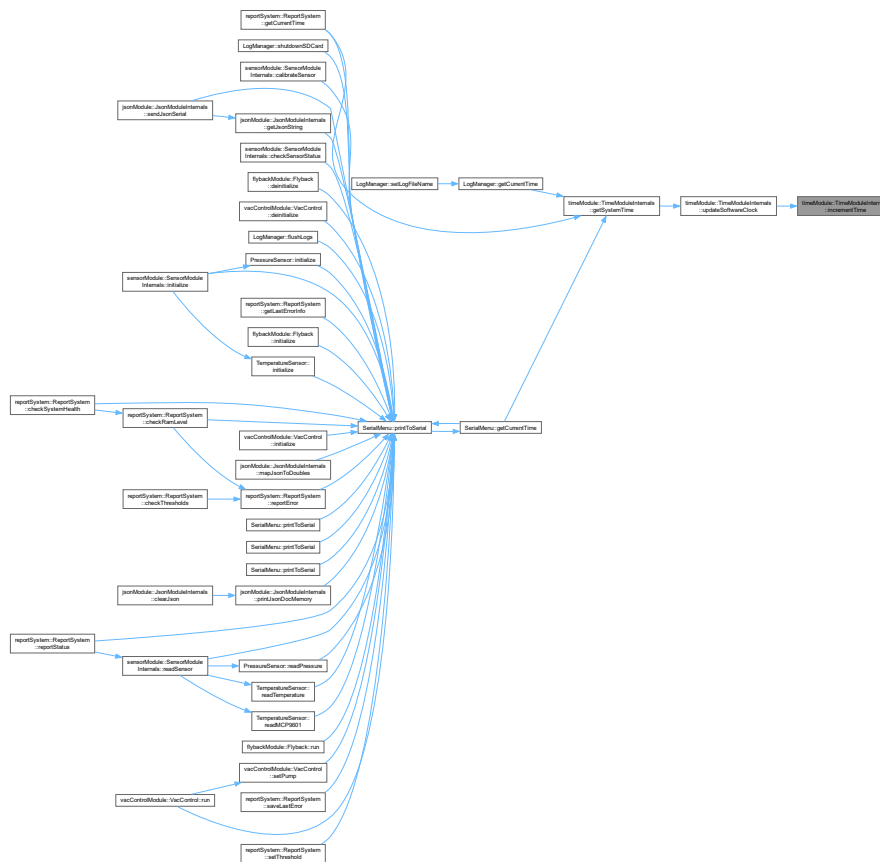

```
void TimeModuleInternals::incrementTime (
    DateTimeStruct * dt ) [static]
```

Function to increment the time of the system.

Parameters

<i>dt</i>	-> DateTimeStruct to increment time
-----------	---

Here is the caller graph for this function:

6.30.2.5 setSystemTime()

```
void TimeModuleInternals::setSystemTime (
    const DateTimeStruct & dt )
```

Set the System Time object of the system.

Parameters

<i>dt</i>	-> DateTimeStruct to set the system time to.
-----------	--

Here is the caller graph for this function:

6.30.2.6 setTimeFromHas()

```
bool TimeModuleInternals::setTimeFromHas (
    const String & timeString )
```

Set the Time From Has object to the system time.

Parameters

<i>timeString</i>	-> The time string to set the system time to.
-------------------	---

Returns

true -> if the time was set successfully
false -> if the time was not set successfully

Here is the call graph for this function:

The documentation for this class was generated from the following files:

- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/timeModule/timeModule.h
- C:/Users/Adrian/Documents/git/FFRESW/eSW/libraries/timeModule/[timeModule.cpp](#)

6.31 vacControlModule::VacControl Class Reference

[VacControl](#) class to manage the vacuum control system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes.

```
#include <vacControl.h>
```

Public Member Functions

- void **initialize** ()
Initialize the [VacControl](#) System This method sets up the pins and prepares the system for operation.
- void **deinitialize** ()
denitalize the [VacControl](#) System This method shuts down the pins and prepares graceful restart.
- bool **isInitialized** () const
Get the state of the [VacControl](#) system.
- [SwitchStates](#) **getSwitchState** ()
Returns the state of the main switch.
- [Scenarios](#) **getScenario** ()
Executes logic depending on which Main-Switch state is active.
- [Pressure](#) **measure** ()
Measures the actual pressure of the system.
- void **setVacuumLed** (float pressure, float targetPressure)
Controls the vacuum LED based on the current and target pressures.
- int **getScenarioFromPotValue** (int potValue)
Determines the scenario based on the potentiometer value.
- void **setPump** (bool flag)
Set the Pump flag.
- void **run** ()
Runs the main control loop for the [VacControl](#) system.
- void **setExternScenario** (int pressure)
Function to set an external scenario, typically from remote input.
- int **getExternScenario** ()
Getter function to retrieve the current external scenario state.
- void **externProcess** ()
Process external data for scenarios (currently unused)
- void **setExternPressure** (float pressure)
Sets the external pressure value.
- float **getExternPressure** ()
Gets the external pressure value.

6.31.1 Detailed Description

[VacControl](#) class to manage the vacuum control system This class provides methods for initializing the system, configuring the timer, measuring parameters, and handling different system states such as ON, OFF, HAND, and REMOTE modes.

6.31.2 Member Function Documentation

6.31.2.1 externProcess()

```
void vacControlModule::VacControl::externProcess ( )
```

Process external data for scenarios (currently unused)

This function could be expanded to process external scenario commands if needed.

6.31.2.2 getExternPressure()

```
float VacControl::getExternPressure ( )
```

Gets the external pressure value.

Returns

The current external pressure value

Here is the caller graph for this function:

6.31.2.3 getExternScenario()

```
int VacControl::getExternScenario ( )
```

Getter function to retrieve the current external scenario state.

Returns

The current external scenario state (integer)

Here is the caller graph for this function:

6.31.2.4 getScenario()

```
Scenarios VacControl::getScenario ( )
```

Executes logic depending on which Main-Switch state is active.

This function decides which scenario to run based on the current state of the system.

6.31.2.5 getScenarioFromPotValue()

```
int VacControl::getScenarioFromPotValue (
    int potValue )
```

Determines the scenario based on the potentiometer value.

Parameters

<i>potValue</i>	The value read from the potentiometer (used for pressure regulation)
-----------------	--

Returns

The corresponding scenario based on the potentiometer value

Here is the caller graph for this function:

6.31.2.6 getSwitchState()

```
SwitchStates VacControl::getSwitchState ( )
```

Returns the state of the main switch.

Returns

The current state of the switch (Main_Switch_OFF, Main_Switch_MANUAL, etc.)

6.31.2.7 isInitialized()

```
bool VacControl::isInitialized ( ) const
```

Get the state of the [VacControl](#) system.

Returns

true -> [VacControl](#) is initialized and ready
false -> [VacControl](#) is not initialized

6.31.2.8 measure()

`Pressure` `VacControl::measure ()`

Measures the actual pressure of the system.

Returns

`Measurement` -> A `Measurement` object containing the current pressure

Here is the call graph for this function:

Here is the caller graph for this function:

6.31.2.9 run()

`void` `VacControl::run ()`

Runs the main control loop for the `VacControl` system.

This function checks the current system state and performs actions accordingly (e.g., switch states, pump control, LED control). Here is the call graph for this function:

6.31.2.10 setExternPressure()

`void` `VacControl::setExternPressure (`
 `float pressure)`

Sets the external pressure value.

Parameters

<i>pressure</i>	The external pressure value to set
-----------------	------------------------------------

6.31.2.11 setExternScenario()

```
void VacControl::setExternScenario (
    int pressure )
```

Function to set an external scenario, typically from remote input.

Parameters

<i>pressure</i>	The external scenario pressure value
-----------------	--------------------------------------

6.31.2.12 setPump()

```
void VacControl::setPump (
    bool flag )
```

Set the Pump flag.

Parameters

<i>flag</i>	This is the boolean flag to set
-------------	---------------------------------

Here is the call graph for this function:

Here is the caller graph for this function:

6.31.2.13 setVacuumLed()

```
void VacControl::setVacuumLed (
    float pressure,
    float targetPressure )
```

Controls the vacuum LED based on the current and target pressures.

Parameters

<i>pressure</i>	The current pressure in the system
<i>targetPressure</i>	The target pressure to reach

Here is the caller graph for this function:
